Carnation Notes.

While nearly all the fungoid diseases affecting the carnation have been well studied and the results of the investigations printed in these pages, there is no class of diseases with which the grower is less familiar. The scientific descriptions are little understood by the florist and they need to be written up in a practical way. Unless a very close observer one would hardly recognise any of these troubles in their early stages. The spores are ever present in the atmosphere ready to attack the plant whenever the opportunity offers; but the beginning is so small as not to be recognizable excepting under the microscope. The two most important diseases of this class are known as spot and rust.

Spot seems to have accompanied the carnation in all its rambles. Wherever we find the carnation we find more or less spot. The plants will be free from it at times and at others it will be so bad as to destroy them. It is our belief that proper attention to the plants, keeping them in a thrifty growing condition, is the best preventive we can name. The spot is more the result of bad management and uncongenial surroundings, and naturally follows a weakened condition of the plant.

W. R. SHELMIRE.

St. Louis Convention.

The ninth annual convention of the Society of American Florists opened at the Exposition Building, St. Louis, at 11:15 a. m. Wednesday, August 9. There were about four hundred members present. The hall was prettily decorated with bunting, plants and vases of flowers.

Mr. J. M. Jordan, on behalf of the St. Louis Florists' Club, opened the meeting with a few words of welcome, and expressed the hope that the society's stay would be pleasant and profitable. He said that, while the attendance might be less than at former meetings, still he saw in the upturned faces before him the intellect, the will and the ability to accomplish great things. He hoped that their deliberations would be free and full, and that the society would advance another step upon the ladder of floriculture and horticulture. He then introduced, as a representative citizen of St. Louis, one who had laid aside pressing official duties and waiting visitors to say a few words on the important subject before the convention—the Mayor of the city, Hon. Cyrus P. Wallbridge.

Mayor Wallbridge was received with great applause. He said that, in looking at a beautiful flower he had often wondered how it was possible for a single stem to absorb from the soil and the air all the various colors in that flower and deposit them in such systematic perfection. He had often asked himself, "Where is this switchman who tells the purple where to go, what signal does he make to the crimson or the blue to take a certain track and stop at a certain place—who is the General Manager of this perfect, complicated system which never makes a mistake and never finds an open switch. [Applause.] Was there a florist here who could tell him—was there a botanist present who could answer? If compelled to do so, such a one would fall back on the answer of the father, when his infant son had reached the limit of parental knowledge, who was obliged to respond, 'God.'"

"These representative men and women had not come here to listen to speech-making. A man must be presumptuous indeed who would attempt to entertain with flowers of rhetoric the people whose lives are devoted to the cultivation of the flower. [Applause.] But a man must be poor indeed who would extend a cordial welcome to such people in the home of Henry Shaw." [Applause.] This welcome, the mayor said, he did now extend. In the name of the city he bid the visitors "God speed", the freedom of her gates he extended to them, concluding with the wish that they might be successful in their efforts to obtain a more effectual way to assist nature in her endeavors to beautify this world. [Cheers.]

The response to the mayor's words of welcome was made on behalf of the society by Mr. E. A. Seidewitz, of Baltimore. After saying that he scarcely knew what reply to make to these short and sweet words, he referred to the objections to meeting at St. Louis, unsuccessfully brought forward last year when the invitation to come here was extended. Chief among these was, that "St. Louis is hot." He thought if they had been told, "St. Louis is smoky," they would not have been disappointed. But behind the dark smoke he had found brightness and progress—a progressive city, to see which did an American good. St. Louis possessed another characteristic. Of all genuine symbols of welcome the handshake is the most significant; and the chairman of the committee on trade exhibits had given him (Seidewitz) an evidence of this on his arrival by one of those hand-shakes which made the visitor feel it came strong and direct from the heart. After hearing the mayor's greeting, the delegates felt more than satisfied they had come among a truly hospitable people. [Applause.]

"Although St. Louis is a city of comparatively recent date," continued the speaker, "we have only to look around to see at every step the evidences of progress, and we eastern people must admit that we have much to learn from our western brethren. As we were crossing the great bridge last night I realized that we were entering a city great in progress and industry; and when I reflect that men like Henry Shaw, of whom the mayor has spoken, have been natives of St. Louis I know that the city is one in which the love of horticulture has not declined."

These considerations the speaker believed were stimulants to the society to make its work, at the present meeting, exceptionally creditable and its progress specially marked. [Applause.] Referring particularly to one phase of the address, which he thought was one that all ought to take to heart, he said: "All the members of this society, I believe, are patriotic Americans; we have a kindly feeling for the men across the water engaged in the same profession in which we are engaged; yet, if nothing else, patriotic pride and correct ideas of political economy should stimulate us to do our own work and to stand on our own feet. [Long applause.] This society has a close connection with the Union within which the climatic conditions are such that, in fact, everything we now import from across the water can be produced within our territorial limits."

The speaker went on to say that in the matter of Roman hyacinths, for instance, the enormous amount of money now sent to France could be saved through home production. The present financial depression and the balance of trade being turned against us had been supposed to

be due to the sending abroad of too much money. The speaker thought this was a contributing cause and that if members of the society could do something to stimulate the production of American hyacinths on this side of the water it behooved them to do it. [Applause.] He also eloquently commended the lofty sentiment of the address, its presentation of the æsthetic side of the business and its references to the necessity for a higher estimate of it and the qualifications necessary for it.

Mr. Jordan then introduced President Smith, who assumed the chair and made his annual address. The address was listened to with the closest attention and at its conclusion the applause was great and prolonged.

A motion was at once offered by Mr. John Burton that the president's recommendation regarding a committee of five to obtain statistics of import and export trade in goods pertaining to ornamental horticulture be adopted, and the motion was unanimously carried.

The secretary's report was then read by Secretary Stewart. Treasurer Hunt next followed with his annual report.

The call for reports of special committees brought up Mr. W. A. Manda for the committee on medals, who said that the dies were all ready and imprints were ready to be shown. Mr. E. G. Hill next addressed the meeting in a few words of commendation of the president's speech.

The afternoon was devoted to a very enjoyable ride through the most beautiful sections of the city, a very large number of members participating, about fifty carriages and wagonettes being required to hold the party. The trip included Lafayette Park, Compton Hill Reservoir grounds, Tower Grove Park and Forest Park. A photograph of the party was taken at the latter place.

At Wednesday evening's session Mr. C. H. Allen's essay on carnations was read, after which followed an animated discussion on same by Messrs. Fred Dörner, Jr., E. G. Hill and others.

The question box was then opened and several interesting subjects came up for treatment, regarding which detailed report will appear in a later issue.

Mr. Elmer D. Smith's essay, under the auspices of the American Chrysanthemum Society, was the next thing on the program. Mr. Smith being prevented by sickness from attending the sessions, his paper, a very comprehensive one (see elsewhere in this issue), was read by Mr. John Thorpe.

The annual meeting of the American Chrysanthemum Society followed. The committee appointed last year presented a new constitution and by-laws for consideration and the same were adopted. The annual election of officers resulted as follows: Elijah A. Wood, West Newton, Mass., president; E. G. Hill, Richmond, Ind., vice-president; E. D. Smith, Adrian, Mich., secretary; M. A. Hunt, Terre Haute, Ind., treasurer. The next annual meeting will be held

Treasurer Hunt's report showed a balance of \$2,125 in the treasury of the S. A. F.

Among the notable visitors at the convention were Geo. Nicholson, curator of the Royal Botanic Gardens, Kew, England; Prof. Dr. L. Wittmack, Berlin, Germany; Ludwig Schiller, Germany; M. Lemoine, Paris; E. H. Krelage, Holland.

At the morning session Thursday Robert Kift, on behalf of Philadelphia, nominated Atlantic, N. J., for the next convention. John Burton seconded the nomination.

No other nomination being made Atlantic City was the unanimous choice.

Nomination of officers being next in order, E. G. Gillett nominated M. A. Hunt of Terre Haute, Ind.; J. M. Jordan nominated J. T. Anthony of Chicago; D. B. Long nominated John Burton of Philadelphia. Mr. Hunt declined the nomination for president with thanks for honor conferred. For vice-president Robert Kift was nominated by W. K. Harris; for secretary Wm. J. Stewart, nominated by John Thorpe, and for treasurer M. A. Hunt was nominated by J. M. Jordan.

R. F. Tesson then read his essay on rose growing (see elsewhere in this issue). The discussion was quite animated and was participated in by Messrs. Hunt, Turnley, Dillon, Jordan, Coles and Elliott.

P. O'Mara reported for the committee on express rates, and on motion of Mr. Hill a hearty vote of thanks was given the committee for its efficient services.

John Burton withdrew his name as candidate for president.

Thursday afternoon a large number availed themselves of the opportunity to visit the Missouri Botanical Gardens and inspect the grand collection of rare plants. They were met at the entrance by Professor Trelease, and after being escorted through the grounds were invited by the trustees of the garden to partake of a tempting lunch, which was spread on tables under the trees. A group photograph was taken afterwards on the lawn. Before departing three cheers were given for Prof. Trelease, who reluctantly responded to repeated calls with a few complimentary words.

At the evening session W. G. Bertermann's essay on horticultural exhibitions was read by the secretary and was well discussed by Messrs. Seidewitz, Huntsman, Anthony and Hill. A vote of thanks was extended to Mr. Bertermann.

Mr. Gurney's essay, "Old and neglected plants worthy of more general use in outdoor decoration," was then read. President Smith then called upon Mr. George Nicholson of Kew Gardens, whom he introduced as a man whose name is a household word in America. Mr. Nicholson spoke in high praise of America and Americans and briefly expressed his sympathy with the views expressed by Mr. Gurney. The paper was further discussed by E. H. Michel and J. C. Vaughan.

Robert Craig then read his response to the question, how to increase the love of flowers among the people. Mr. Craig's paper was received with great applause. J. M. Jordan then called the Hail Association to order, and the annual meeting of that body was held.

President's Address.

LADIES AND GENTLEMAN, MEMBERS OF THE SOCIETY OF AMERICAN FLORISTS, AND FRIENDS: Custom makes it a duty for your President to make you an address—a sort of President's message, if you will. Well, then, first let us congratulate ourselves, on this our 9th anniversary, as to the vigorous condition, which the reports of your officers will show.

You will permit me to ask a question, asked, I know, at some previous conventions, but of a different character from this one, however. What are we here for? My answer is, we are here to increase and diffuse a knowledge of ornamental horticulture, in all its various subdivisions, among the sons and daughters of men. A higher mission hath no one. To elevate the æsthetic soul of a people, to place before them things of beauty, joys forever, as Keats has grandly phrased it.

The occupation is worthy of the intellect it has secured. The genius of a Thorpe, the intellectual powers of Craig and Hill, the enthusiasm of May and Jordan, the business tact of Norton and Dean, our predecessors in office, would add lustre to any profession. There are many others, but time will not permit us to mention them. As we look back through the short vista of ten years, what noble men have left us to find their reward in a higher evolved condition! The image and shadow makers receive due praise and profit of which we grudge them not; but now the workmen and artists who present to the mind's eye of the people the beautiful reality—the thing itself—are they not entitled to more credit than they have ever claimed?

Ralph Waldo Emerson, one of America's greatest thinkers, says, "Flowers were made for the service of the soul." What food for thought there is in these words! We all know that there are many minds so dull in the æsthetic part of their nature that, as Wordsworth says, "A primrose by a river brim, a yellow primrose was to him, and it was nothing more!"

We once had occasion in our official capacity to escort a party of our selected great men sent to Congress, through the conservatories at Washington. One of them, a narrow utilitarian crank, when he came to the Orchid House, said, "What are the darned things worth anyhow?" Our remark was, "My dear sir, if the Great Architect of the universe had been studying economy when he made you, He would have put you on four feet and fed you on grass." My friend, James A. McKenzie, of Kentucky, then in Congress, now our Minister to Peru, carried the joke somewhat further, but we will leave that to the imagination. We have but little sympathy with the purely utilitarian school. We pity those who live but to eat, but glory in those who eat to live, and find their soul's food in the beauty of the daisy and the heather, the shamrock and the rose, the chrysanthemum and the carnation, the lily and the orchid; not that the latter should be behind iron bars, as was suggested at a previous meeting, unless it is a silver or even a golden bar to confine it on the breast of beauty's self—lovely woman.

Buckle says in his "Influence of Women on the Progress of Knowledge,"

"Women, by encouraging in men deductive habits of thought, have rendered an immense though unconscious service to the progress of knowledge, by preventing scientific investigators from being as exclusively inductive as they would otherwise be."

He also says, farther on: "Those among you who are interested in botany are aware that the highest morphological generalization we possess respecting plants is the great law of metamorphosis according to which the stamens, pistils, corollas, bracts, petals, and so forth, various parts of every plant, are simply modified leaves. It is now known that these various parts—different in shape, different in color, and different in function—are successive stages of the leaf epochs, as it were, of its history. The question naturally arises, who made this discovery? Was it some inductive investigator, who had spent years in experiments and minute observations of plants, and who, with indefatigable industry, had collected them, classified them, given them hard names, dried them, laid them up in his herbarium, that he might at leisure study their structure and rise to their laws? Not so. The discovery was

made by Goethe, the greatest poet Germany has produced, and one of the greatest the world has ever seen. And he made it, not in spite of being a poet, but because he was a poet. It was his brilliant imagination, his passion for beauty, and his exquisite conception of form, which supplied him with ideas, from which reasoning, deductively, he arrived at conclusions *by descent, not by ascent*. When the discovery was announced by Goethe, the botanists not only rejected it, but were filled with wrath at the notion of a poet invading their territory. What! a man who made verses and wrote plays, a mere man of imagination, a poor creature who knew nothing of facts, who had not even used the microscope, who had made no great experiments on the growth of plants, was he to enter the sacred precincts of physical science, and give himself out as a philosopher? It was too absurd. But Goethe, who had thrown his idea upon the world, could afford to wait and abide his time."

The transmutation of parts as indicated in the foregoing extract tells us how, and by what means, Madam Nature rewards Madam Industry with those double flowers which fill with delight all lovers of the beautiful.

We are fortunate in having selected as our place of meeting the city of St. Louis—a city adopted as his home, many years ago, by a young Englishman who, by patient, honest industry guided by good judgment, gathered a handsome fortune in its midst. He, with patriotic ardor, intelligence, and gratitude in his heart, selected this city for the establishment and liberal endowment of the Missouri Botanic Garden. It is hoped men of means in other cities will follow his illustrious example. When deliberating on the matter he called to his council two great men of whom this country will always be proud—Prof. Spencer F. Baird, of the Smithsonian Institution, and Dr. Asa Gray, of Cambridge, Mass. It was my privilege to share their friendship for nearly forty years. Words fail me to express my exalted opinion of them both. Among other good advice given to Mr. Shaw, they recommended Prof. Trelease as Director, and I am satisfied from what I have seen that our kind, genial Vice-President is the right man in the right place.

"If departed ghosts are ever permitted to review the world," Mr Shaw will be at Tower Grove on Thursday next, and return delighted to that heaven where the spirits go "that love their fellow-men."

An erudite and extra-well-read friend of mine says, "It is written in the books that next to the Christian religion the study of the vegetable kingdom has done more and is calculated to do more for the civilization of mankind than any other pursuit of knowledge." By a little use of the imagination, viewing the subject in its various correlations, we can better appreciate the value of Mr. Shaw's great gift to the people of Missouri—and to the world for that matter.

One of the rulers in Rome, just before the advent of Christ, asked Virgil to write a poem to make agriculture popular—hence the Georgics.

Every thinking ruler everywhere since has desired the same thing. We have a suggestion to make on this subject, viz: Remove the compost heap from the front yard; introduce in its stead a little ornamental horticulture. Feed the esthetic nature of the inmates of your home. Your brightest boys and girls will not be so anxious to leave it if the nobler part of

their nature is fed. If they do leave home they will have the fondest recollection of their earlier days, and in all probability will return to rural pursuits in the afternoon of life. The child that smiles so sweetly on its mother's knee, becomes a picture of delight as you offer it a flower; the urchin on the street who begs one shows the latent love for the beautiful, which, alas! is too often neglected. How much of this is due to heredity, how much is innate, we will leave to Dalton and other scientists to determine.

I presume most of you have read the able essay of Mr. Farquhar, in our last year's report, about missionary work among children. We sometimes hear of a glut in the flower market. We would like to suggest that flowers be given to the children and the hospitals—to those who can't buy, rather than to those who won't.

We had hoped and fully expected to conduct this meeting under the inspiring influence and guidance of a national charter, but "the best laid schemes of mice and men gang aft aglee." With a unanimous vote in the United States Senate, and many of the ablest men in that body taking a warm, kindly interest in its passage; with the chairman of the Committee on Agriculture, to whom the bill was referred by the House, actively and earnestly trying in every way to pass it, backed by his committee, it nevertheless failed. This Society is under a deep debt of gratitude to Representative Wm. H. Hatch, of this great State, for his untiring efforts in our behalf. It is only a question of time, however, before we have a charter, and necessary arrangements for the change to a chartered society must be made at this meeting. A few statistics will show how important an industry the Society represents.

The census report for 1891 shows that there are 4,659 floral establishments in the United States, employing 16,847 men and 1,958 women. Their fuel costs over \$1,000,000; their advertising about the same—that is, independent of catalogues; they pay for postage \$767,438.21; for freight and expressage \$1,088,612.41. The sales of cut flowers, hardy shrubs, roses, and other miscellaneous ornamental plants amount to \$26,211,805.77. It is safe to say there is an increase of 20 per cent. on the above figures since then. The report prepared by J. H. Hale for the Census Office has many other interesting items on the subject of commercial floriculture. It does full justice to the S. A. F.

We made application to the State and Treasury Departments at Washington for correct information as to imports. While acknowledging the kind courtesies of the officers of both departments, owing to imperfect classification of subjects, no proper division being made between ornamental and useful articles, we nevertheless got enough to make the statement that we send to the Netherlands, Germany, England, France, Belgium, and Bermuda over \$1,750,372 for bulbs, plants and seeds. It becomes a question for every patriotic American to consider how much of this sum can we retain on this side of the Atlantic. We seek no special protection, Intellect and industry with cheap land and against cheap labor should be our agents. This Society, socially, and by the aid of printer's ink, diffusing proper information as to what is wanted and how to grow it, will soon secure the desired result. California has already taken up the subject of producing such seeds, bulbs and plants as her climate is suitable for. On Long Island, in the State of New York, we saw, two weeks ago, on one estate

alone, ninety acres of fine, healthy gladioli—millions of bulbs. To the Long Island florists, we are told, is due the credit that the gladioli has been changed from an import to an export item of trade. Ten years ago they were all imported. Their price has been reduced to \$10 per 1,000. I am told by experts that many millions of tuberose bulbs are grown in North Carolina and several other Southern States for domestic and export business. A few years ago they were all imported—their price \$10 per thousand. I would like to call the attention of growers to the millions of Roman hyacinths used, and ask, Can't they be grown somewhere on this side of the Atlantic?

The character of the buildings erected is another evidence of the progress of floriculture. A leading firm has informed me that they have erected 40 ranges of greenhouses during the last twelve months, embracing 250,000 square feet of glass surface.

I would earnestly recommend a Committee on Statistics to be formed, to consist of five or more members, and that each State Vice-President be *ex officio* a member of the same. The value of such a committee cannot be over-estimated. A high official in the State Department made the suggestion that we prepare a set of interrogatories, and they will send them to our consuls for the much needed correct information as to what we purchase abroad. Your committee could do this and gather other valuable statistical information, particularly as to the general progress of the profession, etc.

Your Committee on Nomenclature has been of great advantage to the trade; it has greatly purified the catalogues; its very existence has a beneficial result. "A chief among you takin' notes, and, faith, he'll prent them," acts as a deterrent to many an exaggerated description.

A word about chrysanthemums. Whether the society of that name should be an allied but separate organization or a section of the chartered Society of American Florists should receive your thoughtful, serious consideration. The society has done wonders. When Mr. Thorpe wrote me a friendly letter, about nine years ago, telling me, in his usual enthusiastic way, that the Chrysanthemum was, as he styled it, "the coming flower," I was a doubting Thomas, continuing so for some years until I saw at Madison Square Garden a vase with six flowers of Ivory. My enthusiasm led me to visit that vase again and again, with friends and without them. I invited Mr. Wm. K. Harris, not then but now President of the chrysanthemum Society, to take a look at it, when he, blushing modestly, informed me that he was the raiser of it; that it was his child. Never will the memory of that beautiful vase pass from me; it will forever be a day-dream.

We all like to ask questions, as witness our question-box. Is it not possible to reduce the long list of chrysanthemums? So by dropping some no longer near the mark and those so near alike that they are hardly entitled to a separate name. This is simply a suggestion. Think of these things. We would like to make the same suggestion to the newly formed Carnation Society. Make every effort to keep your list as short as possible. Whether you form yourself into a separate allied association or become a section of our chartered Society, it is our duty to help you, our little infant, along; you are a child of great promise.

For the Hail Association we would like to say a word. It has had lively agents

in the shape of large hailstones doing sad work amongst plants and glass lately. Such as are not insured should consider the subject. You will learn all about the Florist's Protective Association from the address on that subject to be delivered at this meeting.

We are under great obligation to the press of the country, especially those who disseminate correct information on our topics. To them we make a polite bow, and say, Thank you. To the papers connected with the trade and those devoted to ornamental horticulture in its various departments we would say, God speed you; may you live long and prosper.

We come now to the subject of subjects at present engrossing public attention—the World's Fair, now being held in an adjoining city. Not having been there yet, I cannot speak of my own knowledge, but I have an abiding faith in the skill and ingenuity of Mr. Thorpe.

Mr. Craig, than whom there is no better judge, says:

"The Directors of the Exhibition show a just appreciation of the importance of decorative horticulture when they provided the magnificent building known as Horticultural Hall, which, with the Wooded Island, has been a source of the greatest interest and delight to the throngs of visitors; no part of the great exhibition has been more constantly crowded, and every feature has been enjoyed. First, the chrysanthemums last fall; then the winter months, when the other departments were almost desolate, were cheered with grand displays of primulas, cyclamens, cinerarias, calceolarias, etc., in rapid succession, and the interest will continue until the Queen of Autumn again presides over the closing festivities."

I have said nothing as yet about the great work our Society has done since its organization. As artists and cultivators the florist of to-day is so superior in most things to ten years ago that the only comparison I can find is as light to darkness. Were I to go back forty years and describe the bouquet, flowers lashed to a stick—next came broom-straws, paper frills, toothpicks, etc.—how all this change came about would take too long to tell. We can only say, I think, the peculiar people living in Boston had something to do with it. To-day the artistic presentation of flowers to customers receives the most careful study. The men in the advance on this subject have, by pen and pencil in the horticultural press, rendered great service to art in its highest sense. All over the country this change has taken place. It is partly—I may say chiefly—due to the annual gathering of the S. A. F. Such members as stay at home thinking they get all in the report are very much mistaken.

The intellectual side dishes are rich and rare—the opportunity to glean ideas from intelligent men on the excursion who would shrink from writing an essay; the aside discussion of the subject up for debate; the grand opportunity to see face to face those you deal with, whose books or articles you read from time to time. An old adage quoted by President Craig in his Chicago address I will repeat: "When you go from home you go to school." He adds, "Those who travel with open eyes can always learn something."

To young men of the profession I would say never miss this golden opportunity to measure yourself. Self-examination is a grand improver of the mind; confess to one another; seek as companions those who will improve you or be improved by

you; enjoy the feast of reason and flow of soul these occasions always present. They are red-letter times in my memory, devoted, as I have been, from childhood's early days to my profession. I never come to our meetings without great benefit. This age of specialists makes it especially an age of progress. The orchid, the rose, the palm, the fern, and the many other plants and flowers that have been made specialties of by many different men, all mingling together on these occasions, presents an opportunity for improvements for young and old that I, for one, would dislike to lose. I love my occupation. I think no one should engage in it who does not. It is, as I have said before, one of the grandest pursuits on earth.

The occasional sneer of gilt-edge mediocrity that "he is only a gardener" has been grandly answered by a gardener's son, my prophet, priest and king—Robert Burns—in his glorious declaration of independence. That

'The rank is but the guinea-stamp—
The man's the gold for a' that.
* * * * *
'The honest man, though e'er sae puir,
Is king o' men, for a' that.
* * * * *
Then let us pray, that come it may,
As come it will, for a' that,
That sense and worth o'er a' the earth,
May bear the gree, and a' that."

Young men, look to it. You have a grand, elevating and ennobling profession. You can aid in "preserving the dignity of man with soul erect."

The American gardener of the future, if manly in his character, will stand up a "Triton among the minnows," engaged in preparing the soul of the people for that higher evolution where hope points to eternal bliss and happiness. It shall soon cease to be the boast that ancestors were successful robbers or butchers of men, but that the glory of our ancestral tree, past, present and future, will be that we advanced the love for the beautiful. Our creed is: "This world is full of beauty, as other worlds above. O, if man would do his duty and fill it full of love," then would come the millennial period, when, in the words of the grand poet-prophet, Isaiah, "They shall beat their swords into plowshares and their spears into pruning hooks; nations shall not lift swords against nations, neither shall they learn war any more."

When beauty, love and truth are the supreme rulers then this earth will be an Eden.

Report of Secretary Stewart.

The eighth annual convention of the Society of American Florists, which was held at Washington one year ago, was one of the most satisfactory and in some respects the most notable on record.

A location so convenient to the great horticultural centers, together with the numerous attractions to be found in the Capitol City, formed a combination which would naturally draw together a large number of visitors but might hardly be expected to ensure a good attendance at the sessions, in fact the reverse might reasonably be looked for. So it is gratifying to record that notwithstanding the extent of the diversions offered by the City of Washington itself and provided by the generosity of our hospitable hosts, the National Gardeners' Club, the sessions were the largest and most uniformly attended in the society's history. The essays were all good and the various subjects were discussed with intelligence and ability, as a perusal of the published

report will show. The trade exhibit was the first since the adoption of the new regulations, the value of which was apparent in the completeness of the arrangements and the absence of all dissatisfaction. Twenty-one certificates of merit were awarded by the judges. One each by the committee on bulbs and seeds and on florists' supplies, two for mechanical appliances, four by the cut flower committee, six by the plant committee, and seven for miscellaneous exhibits.

The executive committee held its annual meeting in this city last January, when many matters pertaining to the welfare of the society were considered and the general plan for this convention was mapped out. The finances were found to be in good shape and the general condition of the society prosperous. The extent to which the so-called auxiliary societies should be accorded participation in our sessions was considered at length, and in response to what seemed to be a general desire the new departure indicated in our program for this meeting was adopted as an experiment. Two important special committees that will make their report at this session have been active and the arrangement effected by one of them, especially the committee on express rates on plants, etc., is regarded by many as among the most valuable services rendered to the trade in general by the Society of American Florists.

The number of members paying dues for 1892 was \$29, of which number 174 were new accessions and 22 were former members reinstated on payment of arrearages. The new members are credited as follows: To California, Georgia, Kansas, Louisiana, Maine, Tennessee, Vermont, West Virginia, Quebec and Japan one each; Connecticut, Kentucky, Ontario and Bermuda two each; North Carolina and Wisconsin three each; Iowa four; Illinois and Indiana five each; Missouri six; Virginia seven; New Jersey eight; Ohio nine; District of Columbia and Massachusetts eleven each; Maryland twenty; New York twenty-six; Pennsylvania thirty-eight. The number of delinquents suspended for non-payment of dues was 214, and the number of resignations during the year was 40.

We have lost four members by death since our last meeting. E. N. McLaughlin, of Boston, died April 1, 1893; Lucius T. Peck, of Boston, April 10, 1893; Thomas Lawrence, of Ogdensburg, N. Y., June 27, 1893, and J. Enos Dickerman, of Calais, Me., July 17, 1893. It is sad to lose even one of our members by death. But in view of the average annual death rate in an organization as large as this we have cause for congratulation and thankfulness that our loss during the past year has been numerically so small. Let us hope that a kind Providence will continue to so favor us and permit us to enjoy for many years to come the pleasure of meeting the old familiar faces and exchanging those fraternal greetings which have come to mean so much to us in these annual gatherings.

Carnations.

BY C. H. ALLEN.

[Read before the Society of American Florists at the St. Louis convention.]

MR. PRESIDENT, LADIES AND GENTLEMEN:—The history of the carnation—its value to the trade, the diseases to which it is subject and the remedies for the same—have been so frequently and ably discussed by its specialists that, without going over the same series of facts and incidents pertaining to propagation and

development, there is but little to be said. It may be taken without question that the florists from every section of our country, honored as they are by the presence of those from other countries with mutual interests, are not here assembled to hear echoes of past experiences, but to hear sounded some new note in the scale of culture, or in the line of development of the flower for which the American Carnation Society was organized to foster.

There are apparently but two points in the cultivation of the carnation to be considered at this time, and the importance of these, briefly stated, will be sufficient food for thought for the grower for at least another year. Our experience with the carnation shows us that in two respects it is a neglected flower, when compared with other objects for the florist's care. To get flowers of any desired class of superior merit there are certain indispensable conditions to be observed. The first is to secure healthy plants, those with constitutions that will enable them to assimilate the greatest amount possible of plant food. Strength is a necessary condition of reproduction, and from Nature's standpoint plants are only reproducers through the agency of their flowers. It, therefore, follows that strength of plant and abundance of flowers are cause and effect.

The first neglect we shall notice in the propagation of the carnation is that selection as a means of increased vitality is sadly overlooked. When any plant has been grown for a long series of years under unnatural conditions, as in the case of carnations from cuttings, instead of from seeds, there will be a natural tendency towards deterioration, which will manifest itself in various ways, the more common being an impoverished vitality. This is attributed to the too commonly expressed opinion that varieties run out. Varieties do run out, but from neglect in a majority of cases. When the same care is used to perpetuate a variety that was given by the systematic hybridizer to produce it there will be no deterioration. When varieties like Silver Spray, Buttercup, Wm. Scott, Edna Craig and numerous other excellent sorts are produced the great object is to perpetuate them. To that end the greatest care in selection should be observed, health being the important consideration. Cuttings should, in all cases, be taken from plants showing the greatest vigor in growth, color and substance of foliage and a tendency to free flowering.

It is the ultimate object of all plant life to produce seed, and the plants showing the greatest tendency to bloom show, as a rule, the greatest amount of vitality, and from such plants should cuttings be taken. Hence has arisen the general opinion that cuttings should be taken only from stems bearing flowers. With due respect to disseminators of new varieties, it is our opinion that the tendency of the trade is to make the most of a variety rather than the best. The effort has not been to select with a view to developing health and strength, but to produce as many plants as possible, while they bring a high price because of their novelty.

The general impression is that the carnation will not stand as much manure as the rose or chrysanthemum. Quoting from Phillip's *Flora Historica*, published in 1820, Maddock recommends a compost of one-half rotten horse dung one year old, or that has been used in a hot-bed, one-third fresh, sound, loamy earth, one-sixth coarse sea or river sand. These

ingredients are to be mixed together in autumn and used the following spring or autumn. Mr. Hogg (at the same time) recommends at the rate of three barrows full of loam, one and a half barrows of garden mould, ten barrows of horse dung, one barrow of coarse sand, to be mixed and thrown together in a heap or ridge and turned two or three times in frosty weather. On a dry day toward the end of November take a barrow full of fresh lime which, as soon as it is slacked, strew it over while hot in turning the heap. This destroys the slugs, worms and grubs.

Compare these formulas with the composts used by the majority of growers of this country to-day. As an experiment last September I planted a bench of Lizzie McGowan in soil, one-half well rotted cow and horse manure and one-half decayed sod, the plants being set one foot apart to allow free circulation of air. As soon as the roots had taken hold I began using water enriched with one peck night soil and two ounces of nitrate of soda to fifty gallons of water, applying the same once a week until January first, twice a week thereafter. Disbudding was attended to thoroughly, one bud being left to a stem, all others being removed as soon as they appeared. Results: long, stiff stem, fifteen to twenty inches long, flowers three inches in diameter; returns from commission dealer, November 15 to December 20, three dollars per hundred; Christmas week five dollars per hundred; January first through Lent three dollars per hundred; Easter six dollars per hundred. Hereafter I shall disbud and fertilize all carnations in my houses more heavily than I did the McGowans last year. Another experiment: Plants taken from sand May first, planted June first on bench, in house which has side and ridge ventilation, soil as rich as used for McGowans last season are now, August first, showing much better color and substance in foliage than plants of same sorts rooted April first and planted outside, the latter having to stand the severe drought of the past two months. We have been able to water and care for those inside at little expense.

This experiment has been made to settle for ourselves the question, can carnations be grown inside during summer to an advantage? The full result of this test can not be given until the plants outside have been tested the coming season with those which have been housed all summer. From present appearances I should not hesitate to fill my houses with plants in June for flowering the following season.

In conclusion: Let me ask of you who are growers the careful, liberal treatment of the carnation to which it is justly entitled. The results will be greatly to your advantage, from a financial standpoint, and will bring into prominence a flower that is endeared to every lover of plant life. I thank you for your kind attention.

Westward, Ho!

The combined New York and Boston delegation for the St. Louis convention numbered between fifty and sixty. Vermont, Maine and Connecticut were each present in the person of a solitary representative, a fact which these three gentlemen deplored, but which was a more creditable showing than was made by two or three other states which were not represented at all. The start on the afternoon of Monday, the 7th, was made under most favorable circumstances, a glorious shower of rain having laid the

dust and given a beautiful freshness to the country scenery, besides setting the minds of the travelers at ease regarding their stock planted out in the open ground.

The meeting of the New York and Boston parties at Rotterdam Junction was characteristically cordial, but altogether it was the quietest and best behaved crowd that ever set out for a S. A. F. convention. The old war horses stayed at home this time and there was no one to "whoop her up," so all arrived fresh and bright in St. Louis on Wednesday morning in good condition to enjoy themselves.

The Boston folks had been well remembered by the stay-at-homes, as was attested by sundry parcels in their possession, which had evidently been intended by the donors to atone in a measure for their own remissness in staying at home on such an occasion. It was a Boston man also who had with him a letter of introduction to the chief of police of St. Louis recommending him to the kind consideration of that gentleman. The long day on the train was pleasantly passed and amusing incidents were not wanting. Charlie Allen purchased a half bushel of peaches with which to treat the crowd, but half of them proved to be unripe and were hard enough to come in useful as missiles, which flew in all directions during the wait in the train yard at Detroit, the affair culminating in a pitched battle between Joe Manda's party and half a dozen colored porters. When night came, however, some of the wasted peaches would have been welcome, for the dining car missed connection and there was considerable scrambling to get anything to eat. P. O'Mara generously dividing his last crust of bread with his hungry companions was a sight fit for the gods, and not less so was J. A. Dirwanger's run for the fleeing train at a country station where a short stop was made next morning. But he held on to his sandwich. Altogether it was a pretty hungry party when St. Louis hove in sight on Wednesday morning. Warren Ewell's girl had noticeably decreased and Wm. Dilm's slender form was more attenuated than ever. But when the Southern Hotel was reached it did not take long to satisfy craving appetites. The Philadelphia, Washington and Cincinnati people were found already on the field. The only serious accident that had occurred on the trip happened to Worcester Lange's new brown derby, which got shut up for a whole day in an upper berth and came out as flat as if a steam roller had run over it.

CANTON, O.—C. Lindacher has built a rose house 20x125.

NEW ORLEANS, LA.—At the annual meeting of the New Orleans Horticultural Society the following officers were elected: M. Cook, president; J. H. Menard, vice-president; John Eblen, treasurer; Paul Abele, secretary. The financial condition of the society is excellent, and the membership has very largely increased since their late exhibition.

We request subscribers to make remittance by draft or money order when renewing subscriptions, and to keep a record of the numbers and dates of same. This is to guard against losses in the mails.

Bench Grown Chrysanthemums for Exhibition Purposes.

BY ELMER D. SMITH, ADRIAN, MICH.

[Read before the St. Louis meeting of the Society of American Florists.]

MR. PRESIDENT, LADIES AND GENTLEMEN:—The growing of chrysanthemums on raised tables and benches has been in vogue but a few years. Yet there has been so much said and written on this subject that I fear it will be impossible for me to offer you any ideas that are new. The despondent cultivator claimed the acme had been reached at the beginning of the present decade; which echoed and re-echoed, until drowned by the din of progress. As long as competition continues to grow keener and each exhibitor exerts greater mental and physical energies, either to depose a renowned competitor or to maintain his own pre-eminence, so long will there be improvement in this very important branch of chrysanthemum culture. I cannot point out a method and assure you it is the best, as my short experience with the bench system (beginning in the fall of 1890) will not justify such precision. Equally good results have been attained on light or heavy soils, enriched with either animal or chemical fertilizers, and where a crown or terminal bud has been chosen. Confronted by such facts, it would be foolish to set forth specific rules and advise them rigidly enforced, and more particularly so when we consider the prime factors are soil, light, air, water and food, modified to a greater or less degree by the quality and quantity applied. Fine chrysanthemums are acquired much the same as intellectual and financial treasures, not by the great exertion of to-day, but by continually adding little by little each day.

Mr. John Thorpe, our honored and beloved chieftain of floriculture and the father of the chrysanthemum in America, struck the key note when he said: "Eternal vigilance is the price of good chrysanthemums." I shall not try to instruct the expert, as I am aware there are many present who are better versed than I, and will be gratified if any of the suggestions offered are of use to the beginners, to whom this essay is addressed, hoping if you are enthusiastic on this subject to incite still greater incentives. I will briefly allude to the methods which appear to be practical, as they have presented themselves in actual experience, and occasionally touch upon those practiced by expert growers, beginning with selections of varieties.

The selection of suitable varieties is the first important matter for consideration by the inexperienced cultivator. There are so many good varieties now in commerce you can scarcely go astray, but, should you feel incompetent, I will mention seventy-five, all of which are good, although not including the new varieties of the present year, as many of those I was unable to see last fall; hence in justice to all disseminators, I will omit them and let you form your own conclusions next November: Ada Spaulding, Alcazar, A. Ladenburg, Beacon, Cullingfordii, C.

H. McCormick, Col. W. B. Smith, C. B. Whitnall, Domination, David Rose, Dr. Callandreaux, Etoile de Lyon, Ernst Asmus, Eda Prass, Excellent, Emma Hitzeroth, Edward Hatch, Exquisite, Flora Hill, G. F. Moseman, Goguac, G. W. Childs, Golden Gate, Harry E. Widener, Harry May, Harry Balsley, Ivory, International, J. C. Vaughan, John H. Taylor, Joseph H. White, F. Schuyler Matthews, Kioto, Lillian B. Bird, Lord Wolseley, Louis Bochner, Miss Minnie Wanamaker, Mrs. Libbie Allen, Mr. H. Cannell, Mrs. M. J. Thomas, Mrs. Chas. H. Wheeler, Mrs. Frank Thompson, Mrs. Geo. Rundle, Mrs. A. C. Burpee, Mrs. Irving Clark, Mrs. W. Baker, Mrs. J. G. Whildin, Mermaid, Mrs. Langtry, Mrs. L. C. Madeira, Mrs. I. Forsterman, Mrs. W. H. Phipps, Jr., Mrs. Maria Simpson, Miss Helyett, Mrs. Jerome Jones, Mr. Hicks Arnold, Mrs. Robert Craig, Mrs. R. C. Ogden, Mrs. J. W. Morrissey, Mrs. W. F. Dreer, O. P. Bassett, Pelican, Princess of Chrysanthemums, Roballion, Rose Queen, Roslyn, Sec'y Farson, T. C. Price, Tuxedo, V. H. Hallock, Violet Rose, Viviani-Morel, W. H. Lincoln, Waban and Wm. Falconer.

In this country the large premiums are offered for one hundred to two hundred blooms, in twenty-five to fifty varieties; irrespective of type, and, as we all at present favor those of large size, it is safe to say that the greater part of those shown in America belong to the Japanese types. It is to be regretted, however, we cannot arouse more enthusiasm in behalf of the incurved and anemones, as there are none more beautiful when seen at their best. The varieties most suitable for this purpose include many of the Japanese and Japanese incurved and a few of the reflexed anemones and incurved types, and should be such as have abundant foliage and strong flower stem, with bloom of large size and good substance. Very double high built flowers are preferable to those with scanty petals, even though they cover the center.

Assuming your plants are at hand, propagation is next in order. The propagating of chrysanthemums from soft wood cuttings is so simple and well understood that it scarcely requires detail, as to *modus operandi*. Clean washed sand is considered the best material for the cutting bench, but when available, the following may be substituted, viz.: Coke, brick and stone finely crushed and screened, so as to retain sufficient moisture to keep the cuttings from flagging, will give very satisfactory results. For three years we have used coke dust and fail to see wherein sand has greater advantages, as the cuttings so rooted have been in the best condition. As you are aware, propagation may be commenced as soon as the stools are of sufficient length, which generally occurs by December 15, and may be continued until August 1, but I doubt if the late struck plants produce as fine solid blooms as those propagated earlier. Doubtless there are many here who have had the same experience as I, securing good blooms from W. H. Lincoln, L. Canning, Gloriosum, Viviani-Morel and many others, while Flora Hill, Mrs. M. J. Thomas, Etoile de Lyon and nearly the whole of the Mrs. Chas. H. Wheeler class have been unsatisfactory, from late struck plants. Our English friends, who have given pot culture very careful consideration, advise early propagation, as early as December for some varieties, and January and February for others. This may seem impracticable in this country, where the day atmosphere throughout the summer

keeps the wood in a semi-ripened condition, thus insuring bud development early in autumn. Yet I fear we err when we ignore their teaching and plunge headlong into late propagation without even considering the constitutional peculiarities they inherit. It is true the vigorous varieties will do well, but if weak in growth they will certainly require more time in which to store sufficient strength to put forth their best efforts. There are some which can hardly be classed as constitutionally weak that will need the same attention; of such, Ada Spaulding, Harry E. Widener, Etoile de Lyon and Mermaid are examples. Had the subject been cut flowers for commercial purposes, where the cost of production must be considered, then I would have recommended May and June as the best time for propagating the bulk of the stock; but where the object is wholly fine blooms for exhibition I think eight weeks earlier will be none too soon, and the result thus obtained will fully compensate for the extra labor.

From the first to the fifteenth of June will be a good time to plant if the house can be put in readiness without too great a sacrifice, but each grower should consider his own interest in this matter, for if the plants have been shifted along and are not drawing too much two weeks later will answer as well. When planting on old benches it is well after removing the soil to give a good coating of lime wash or a light sprinkling of air slacked lime before refilling; this will not only sweeten the benches, but will be beneficial to the plant later on. No one will doubt the efficiency of new composted soil which has been prepared about the same as for roses, of old sod piled with about one-fourth its bulk of well rotted cow manure, and it may be either of a clay or sandy texture. When heavy soil is used it should be opened with sharp sand or coke dust, for if too retentive it may give you some anxiety in dark lowery weather, for owing to its excessive moisture the application of liquid enrichment must be deferred some days, even though they need encouraging. Various depths of soil are used, from three to eight inches, but where close attention is given to feeding I prefer not to exceed four inches, as the desired conditions can be maintained easier than where greater depth is used. It is true shallow benches necessitate constant attention through July and August, yet the advantages are so pronounced during the continued rainy weather of autumn that one feels well paid for the extra labor. Some growers spread an inch of manure, either rotted or fresh, on the bottom before filling the benches with compost, and no doubt procure fine blooms, but would not the plants receive greater benefit if the same material was applied as top dressing or in liquid form after they have made sufficient growth to take up the food incorporated in the compost? I would say yes. Although unable to give you proof obtained by actual experiments, newly composted soil with only sufficient manure to start the plant off briskly, followed either with top dressing or liquid application (as you choose) to keep them in good vigor will be a safe and economical method to pursue.

At what distance apart to plant may be somewhat perplexing, and should be decided upon by each grower by considering how many blooms he would like the plants to produce. You must bear in mind we are to encourage the accumulation of abundant reserves to be expended in the blooms, therefore the less they are

divided the better the result. The Japanese rule, one bloom, is the best, although a plant will produce three or four very fine blooms. If you decide upon three or more, ten to twelve inches each way will be sufficient, and six to eight inches for single blooms. There is considerable difference in the height of chrysanthemums at maturity, but if you give this a little consideration before planting you will produce better effect in the house, as well as avoid over-shadowing dwarf varieties by tall ones. A close observer will notice day by day the varied progress of his plants, which will assist him in their arrangement, although records taken every year will not only further facilitate, but insure greater accuracy. Plant the dwarf ones on the front row of each bench or together in one end of the house; at all events do not place them between tall varieties, for where this occurs both plant and labor are lost. Very often only a few of each variety are planted, as in the case where novelties and other scarce sorts are being tested; then houses running east and west are preferable, with the plants set in rows across the benches, which will allow the sunlight to reach them all some time during the day, even though they are not uniform in height.

Before proceeding further, look to the shading and see that it is not too dense or entirely removed by heavy rains. We continue to use whitewash and apply with the brush, leaving about an inch and a half on each side of the bars unpainted; this admits light to all parts of the house, as the lights and shadows are continually shifting. Set the plants rather firm, give a liberal watering, and the planting is complete. As the heat is increasing at this season you will find light syringing once or twice a day will be very beneficial, but avoid for the first three or four weeks heavy watering, as the soil is apt to become sodden, particularly if of a heavy texture, which is soon followed by yellow or sickly foliage. Good judgment in watering is essential, so therefore avoid the wet places and see that the dry ones are made wet. In a month from the date of the planting they should be making strong growth and water may then be given more copiously, until the buds are ready to burst, and then again be careful, and as far as possible do this work early in the day, to insure a dry atmosphere at night, as the dew falling on the expanding petals is apt to cause decay. A few days after planting see that the soil is well stirred to remove all weeds which may be starting and this should be repeated occasionally until the roots appear at the surface, when it may be discontinued for fear of injuring them.

In a few weeks staking and tying will claim your attention for a day or so, and this may be done in many ways. Some use wire or cord in the place of stakes, fastening them to strips at the roof and hanging down to the plants, while others stretch several wires over each row, much the same as for grape trellises. We have adopted the system generally used in rose houses, which is as simple and practical as any. Take No. 18 galvanized wire, strain and securely fasten over each row, about three feet from the bench, and to this the top of each stake is tied, after being placed in proper position. The stakes, as a rule, will have to extend far above the wire, according to the height of the plants, and if left too long the ends may be cut off just below the buds, and here securely tie after the disbudding has been done, thus insuring straight stems. You will likely experience some trouble in

tying the back row, especially where the benches are four feet wide. In such places we use No. 20 copper wire, cut three inches long and bent in about the same form as a capital C. Taking it between the thumb and finger with the open side out, place around the plant and stake, then press together until the ends pass, which securely incloses both in the ring thus formed.

Fresh air is quite as essential in the vegetable as the animal kingdom if perfect health is desired, and is very important to the plants we are treating. Give air at all times and abundantly when the plants are making rapid growth, continuing this until the buds begin to burst. The foregoing should be practically modified when sudden and severe changes in the temperature have occurred and where retarding is necessary. Judgment must be used from the time color appears to maturity and be governed by the nature of the weather and the date to be shown as compared with the present rate of progress. As the flowers begin to unfold continue the ventilation at night, as the circulation of air prevents dew and will give a better color to the blooms than where heat is resorted to to dispose of the surplus moisture. Avoid the use of heat as far as practicable, but when the thermometer drops below 38° a little heat will be needed and at the same time slight ventilation will be beneficial.

After the plants have attained two feet in height it is well to remove a few of the lower leaves and when four feet has been reached there will be no harm if the lower fourth has been disleaved, for those remaining will be sufficient to enact their natural functions. This will admit air more freely and give a chance to note the condition of the soil.

Insects of all kinds must be looked after; of such the aphid is most common and may be kept in check by applying tobacco dust after syringing. As soon as the buds are well formed two or three smokings should be given to destroy all insects at this date, as the use of both of those remedies must be avoided or very judiciously applied after the color begins to appear. Grasshoppers are sometimes very troublesome and the best remedy for them is hand picking; this should be done as early in the morning as is convenient, as they are then more docile and easily caught, but if snails are troublesome take a lamp or lantern and search for them before retiring at night.

Probably one of the most important topics to be considered is feeding to enhance floral embellishment, which is the flower of our subject that has been produced, and we wish to reproduce annually with accuracy and economy. Now let us consider the efficiency, accuracy and cost of such food as we generally use.

It is a known fact fresh cow manure is very stimulating to growth, but its effects present a marked coarseness in stem, leaf and flower and lack of refinement and substance. These qualities can be acquired without detracting from the size, color or contour by the use of chemicals; such at least has been my experience. Next in order is accuracy and a certain amount is essential if we admit food or stimulants are to be used at all, for our aim is the acme and the nearer we approach that point the more acute must be the accuracy. Let us endeavor to ascertain the relative value from this standpoint of those naturally and chemically compounded. When the liquid from the animal manure is to be used I believe the color of weak tea is generally advised, but how easily we are deceived when

apparently on the right track. Take a half bushel of manure from the horse stable and add sufficient water to cover and in twenty-four hours note the color, or if you choose, fill and tightly cork a bottle and then compare this with that which has stood open for a week or two. The ammoniacal constituents have evaporated, leaving the liquid darker and apparently stronger, though containing less alimentation. The same may be said of cow manure, but not to such a marked degree. Commercial and chemical manures, when confined, are protected from air and water, so remain unchanged, thus assuming the same strength at each application if properly prepared. Thus I will leave this matter for your decision.

Now turn to the cost of material, and as near as I can average the price \$1.50 per load of the cubic yard is not far out of the way, and I think it is safe to say one-half bushel will be required per barrel when we average up the quality generally used. So with twenty-one bushels per yard you can have forty-two barrels, at a cost of about 3 1-6 cents per barrel. Eight ounces of nitrate of soda is sufficient for one barrel and will cost you about .14 cents, and five ounces of sulphate of ammonia for about .006 cents and is enough for the same, while four ounces of nitrate of potash will require .02 cents, giving an average cost of .013 cents per barrel.

Animal manure must be put to soak one way or another, and if you are progressive and use a tank and hose for distributing you will have to filter the liquid before applying, while the chemicals are soluble and require no further preparation. It is safe to say the relative cost is five to one in favor of the latter, when all things are considered. Knowing nothing of chemistry and having had little experience with its products, I cannot give you a formula and assert its superiority, as one of such value could only be compounded after years of experimenting with all the elements beneficial to plant growth and floral embellishment. Volumes could be written on this subject, as may be seen when we consider ammonia, potash, soda, etc., are productive of the desired results, and again those results are modified for better or worse by the various forms in which those elements are compounded, such as muriates, nitrates, phosphates and sulphates. Mix one part of sulphate of ammonia with two parts of powdered nitrate of potash (commonly called saltpetre), and by using four ounces of this mixture to a barrel of water you will find it excellent after the plants have absorbed the manure virtues of the compost.

Nitrate of potash and the nitrate of soda of commerce are largely composed of nitrogenous matter, and I prefer the former, as it is nearly or quite chemically pure, while the latter is put at our disposal as found in the natural deposits and is apt to contain elements more or less poisonous to plants when used in adequate quantities. I have noticed when nitrate of soda was used wholly the tissues of the foliage and flowers are flabby, much the same as with cow manure, and lack substance, so essential where blooms are to be staged several days. It will be advisable where soda is more available to use sulphate of ammonia occasionally, or mixed in the same proportions as where potash is used; this will harden the tissues and thus materially add to the keeping qualities.

I previously alluded to the excessive use of manures in the early stages of plant life, and in the same connection I wish to

caution you in the use of liquid foods. Over-feeding at any stage is wasteful as well as injurious, just as much as deprivation is debilitating. Would it not be better to supply in such quantities as can be absorbed without injury, rather than to pamper at any stage of growth? How much food each and every variety will use advantageously can be ascertained only by records taken each year or both quantities applied and the quality of the results. It is certain some will be profited, while others will succumb with the same treatment, and the constitution, as it appears from the root, stem and foliage standpoint, can not be relied upon with any degree of certainty, for example: Mrs. E. W. Clark, which is rather weak

ILLUSTRATION 1.

in root and stem growth, will flourish with more food than Alberic Lunden, which is much stronger. The symptoms of excessive food are varied, according to variety and the date when mistreated, and such are examples, triangular and twisted stem or trunk and contorted petals, which often have the appearance of being burned or frozen. The chemicals referred to may be used in our modern conservatories without being offensive or objectionable in any way, as they are odorless, colorless and tasteless as applied. This fact shows how easy it is to under-rate their strength and over-reach in these matters, so for fear some one of you may be too zealous I will say: Water is the only antidote I know of and should be applied copiously at the first indication, and in aggravated cases hot water will be more effective. When liquid foods of any kind are used great care should be exercised, for if the soil is dry the roots are too active in absorption and thus take too large a dose of the tonic, which acts like strychnine on the human system.

The diversion of the natural inclination of the chrysanthemums to hasten or retard floral development may be of some value to you when the flowers are wanted at a certain date. Early struck cuttings will set buds early if abundance of air is given and at the same time only sufficient water to prevent flagging, as such treatment hastens wood ripening, thus causing bud formation, and the application of heat as well as hot water at the roots will still further hasten the buds into

flowers. In retarding we must do exactly opposite to that which has been done in hastening, thus, strike late, keep wet and close with some shade; this will do the work, but all these details should be carried no further than appear to be practical. In connection with this subject I wish to say, chrysanthemums in New Zealand perfect their blooms in March and April. This fact confirms the theory of hastening and retarding and at the same time teaches us it is not simply because it is November that we have chrysanthemums, but it is the atmospheric conditions that take place in the fall; hence we can have chrysanthemums at any date, providing we can produce the required conditions.

The time is fast approaching when we shall have to consider the important matter of selecting buds. I have taken from the work of Edwin Molyneux the engravings representing these two forms of buds and had them enlarged as they appear before you now in illustrations 1 and 2. No. 1 represents the crown, which as you are aware is formed first, and if selected we must rub out all the lateral growths that are starting from the leaf axils, as shown by the dotted lines. The greater part of the flowers produced are from terminals, as the late struck plants seldom produce crowns, but for fear you may select them without knowing of their peculiarities I beg a few moments for their consideration. In England those buds are taken or selected, as they term it, earlier as a rule than in this country, owing probably to the difference in climate. According to Messrs. W. & G. Drover & Nephew (W. Adam's work), of Fareham, England, those of the Pelican are selected as early as July 26, while those of Etoile de Lyon are not taken until August 28 to September 6. I think on this side there are very few selected before September 1, and the greater part of them from the tenth to the fifteenth. I read you the first entry in our diary for last year. Mrs. M. W. Redfield, crown, taken September 10, fully expanded October 19, size five and a half by five and a half inches, height of plant two and a half feet, and then I find those of Emma Hitzeroth, Mrs. Robt. Craig and Harry Balsley were taken ten days later and were matured November 1. This shows us there was no material difference in the time consumed, as the first named developed sooner, owing to the earlier setting of its bud. It may be well to state that those referred to were hastened into bud somewhat and encouraged at the last with heat; but it shows, however, that our buds mature quicker than on the other side, as it would be impossible for them to show flowers from buds taken at our late date. With the exception of a few varieties their experts prefer the crown, and this is quite likely owing to the fact they do not care for foliage effect, as they show on boards, which necessitates cutting the stem short. With us a flower without its foliage is like a diamond without its setting, for a greater part of our flower buyers exact long stems with abundance of good foliage. This I think should be our standard of excellence for cut blooms where a premium is offered without specifying the type; then their merits would be according to their commercial value, as this governs all products.

Some varieties produce better blooms from crowns than terminals, but also (with a few exceptions) have much longer and stouter flower stems, as is the case with Dr. H. D. Hull, as shown in Illus. 3. You will notice a deficiency of foliage near the flower, which is overcome in Illus. 4,

where the terminal was taken, and this is nearer our standard of excellence. Therefore we would conclude terminals are preferable where there is no great difference in size and form and except in those varieties having a tendency toward weakness of stem. Terminals require less time in development and will be ready for exhibition nearly as soon as the crown, taken three or four weeks earlier. Where crowns are selected there is a tendency toward increasing the number of petals and should not be indulged in only where there is deficiency. I feel this matter of selection is of more than ordinary importance and ask your indulgence in diverting from our subject.

The American Chrysanthemum Society was organized for the purpose of improving the golden flower, hence raisers of seedlings should avoid taking crown, for when disseminated and terminals are selected, for the sake of foliage effect and to meet the requirements of America's ideal flower, there is sure to follow disappointment to both introducer and buyer. On the other hand they should put greater energies in pollenization to secure such as will give the desired qualities from the terminal, for by so doing they are tending in the right direction. In that way and no other can America lead the world with her chrysanthemums. To avoid

ILLUSTRATION 2.

being termed a theorist you will pardon me if I refer to my own productions by saying the blooms of Niveus shown last fall were from terminals, one of which is represented in illustration 5. If you wish to take the terminal rub out the crown, leave one or more of the strongest laterals to grow on. These will advance into the final growth, until intercepted by nature, who to enact her laws of reproduction completes the structure with a bud at the end of the stem, as well as from the leaf axils as represented in Illus. 2. By removing the weaker bud we will greatly increase the size of the flowers of those remaining; this is termed disbudding and is generally done as soon as

ILLUSTRATION 3.

ILLUSTRATION 4.

ILLUSTRATION 5

take the next best. In disbudding begin at the top and work down, for if you reverse this and should happen to break the stem when nearing the perfect bud you will have none in reserve. As far as practical, this work should be done in the morning and on cool and cloudy days, for then they are filled with sap and are more brittle, which makes it easier and safer. As the bud swells we are fast approaching floral embellishment. It has burst and the petals continue to lengthen until we behold its beautiful color, large size and perfect form. This, supported by a stout stem, abundantly clothed with lustrous green foliage, is the perfect exhibition bloom of America. Thus we reach the acme.

Labor Saving Devices.

BY P. O'MARA, NEW YORK.

[Abstract of essay read before the St. Louis meeting of the Society of American Florists.]

The question of labor is perhaps the most important the florist has to consider, for the reason that it is the chief expense in preparing his goods for sale. It is doubtful if in any branch of trade labor enters so largely into the cost of production as in floriculture, and it is very likely that it will ever remain so, from the fact that the operations incident to plant growth must be carried on by hand; there is little if any room for the inventive genius, and the improvements of the future, like those of the past, must be on the lines of simplifying and shortening them. If it is expected that the paper which I have prepared will contain startling new and improved methods, descriptions of new machines or devices for accomplishing work which has heretofore been done by slow manual processes, I fear that dis-

appointment will result. The principal value of such a paper as this is to bring out such, if they exist, and with that end in view I corresponded with the foremost men in the trade, men who are recognized as being ever on the alert for improved methods and machines; but the result was almost nothing, for the simple reason, I believe, that there was nothing to offer.

The greatest strides in labor-saving to be noticed in floriculture have been made in greenhouse building, and the substitution of enduring iron and slate in the construction of benches and superstructures for rapidly decaying lumber. In answer to a letter which I sent to Mr. F. R. Pierson asking him to give me information regarding any new devices he might have in use which were labor-saving, he referred me to his excellent paper on Greenhouse Construction, read before this Society at the annual convention in Toronto, in 1891, as embodying nearly everything in that line which he has in use up to date. In these days when we have two weekly papers devoted to the interests of the trade, conducted by enterprising men, and the spirit of enlightenment is abroad so that knowledge of labor-saving devices is rapidly and thoroughly disseminated through our ranks, there is little left for an essayist on this subject to say that has not been said before. There is no doubt that the greatest labor-saver is a system of work adapted to the needs of the establishment, and a man competent to keep it in working order and with brains and energy enough to change it as the conditions may demand. There are, however, some general principles, which might be followed with advantage, and although not new yet may not be generally known, or if known, practiced as fully as they might be.

It was an axiom with the late Mr. Peter Henderson, under whom I had the honor of learning what I know about floriculture, that "For rapidity of work divide labor." The practical application of this theory consisted mainly in dividing the ordinary operations into as many hands as could be used to the greatest advantage. For instance, in potting, he would have a man do nothing but pot, while a boy would take away the plants and "set" them; another would keep him supplied with pots and cuttings and shade and water the potted plants. In this way, he succeeded in raising the maximum of a day's work in potting such plants as verbenas from 5,000 to 11,500, which one of his men accomplished in ten hours; the same man repeatedly potted 10,000 in a day of ten hours, and I can say from actual experience that the work was as well done as when only half the number was potted. That this extraordinary proficiency was not confined to one man was shown in the potting contest in Madison Square Garden, when one of the men from our establishment—that of Peter Henderson & Co.—potted over 1,300 in a single hour, and two others potted over 1,200 and 1,100 each in the same space of time. This same principle of dividing labor he practiced in market gardening, and with a like result. He invariably had boys to drop the plants for men planting cabbage and celery, and frequently demonstrated that a man with a boy to drop the plants would accomplish more than two men

large enough to determine the most perfect one and also avoid its injury in removing the others. The dotted lines in the engraving denote those to be removed and also the terminal, which if perfect is considered the best and should remain, but if injured in any way remove and

planting singly and each carrying his own plants. This theory of the division of labor he carried into all operations. In packing, he always supplied each wrapper with a boy to turn the plants out of the pots and carry them away. By keeping a man employed at one thing, he performs the same motions so often that he must of a necessity acquire speed, just as type setters, type writers, telegraph operators or postal clerks in our large post-offices do. Another advantage derived from this system is that it keeps the hands together, making it easier for the man in charge to watch them, it makes of each man in charge of a certain job a temporary foreman over those immediately under him, and it generates a spirit of emulation among the men and boys to keep up their end, all of which combined makes a very good labor-saving device for the man who pays the salaries.

Another thing which I consider of the utmost importance in any effort to obtain a saving of labor is, that the employer should foster a spirit of individual enterprise among his employes, each should be made to feel, if possible, that he is not expected to be a mere machine to perform in a perfunctory manner the duties allotted to him; he should be made to feel a personal responsibility, and thus secure the benefit of whatever portion of brains with which nature has endowed him, as well as his physical labor; he should be made to feel that his value depends in a great measure on the suggestions he may make for his employer's benefit. It requires some tact and a knowledge of human nature to secure this, both of which it is assumed the employer possesses, or he would never rise above his fellow workmen, for the vast majority of employing florists, it is known, have risen from the ranks of the florists and gardeners who at one time earned their daily wages. Such men then, above all others, should know that a man of ordinary intelligence constantly engaged in working practice will in all likelihood suggest and carry out improvements, if properly urged. Strict discipline should be maintained at all times and a uniform degree of quiet command enforced; the irritable, blustering employer cannot hope to obtain either in quantity or quality the same results as the one who is at once master of himself and the men under him.

These are some general principles which may properly be included under the head of "labor-saving devices," and I offer them for the earnest consideration of my listeners.

There are a few labor-saving devices in practical operation in our place which may not be generally known, and which might be copied to advantage. One of these is our method of handling two and three inch pots. Under the old method, these as they were emptied in the packing shed or in the greenhouses when shifting into larger pots, were placed in "flats," to be piled away under a bench in a house designated for that purpose; now and for some time past our method is to have empty boxes of a certain size ready and place the pots in them as fast as emptied, thus saving double handling. For two inch pots we generally use a box of 18x12x6½, which holds 250 pots. These boxes we obtain from the local grocers when they sell their canned goods and have the empty boxes on hand. For three inch pots, we use a box 18x13x10, which holds 150 pots. These boxes cost delivered on our place four or five dollars per hundred. The pots when placed in them are just below the edges, so that they can be piled one above another and can be

carted from point to point on our place as needed. This method of handling pots is a considerable saving in labor in the course of a year, and lessens breakage proportionately to the number of times they are handled. The larger sizes of pots we store away in bins prepared for the purpose, and always use a horse and cart to move them to the points where they are to be used; in fact, we use a horse and cart or wagon to move pots and plants wherever it is possible, and save considerable manual labor in this way—the extent of our place naturally suggests this method, on a small place it would hardly be practicable.

For the "flats" in general use in a florist's establishment we use shallow boxes which measure 20x14x1¾ deep; these we obtain from the Standard Oil Co. at \$2 per hundred. These boxes they obtain by importing the tin plate, and as they are nearly waste to them, they sell them at a low rate. Another size, 21x10x1¾ deep, we obtain from them and find them very useful for forcing tulips, narcissus, Roman hyacinths, etc., also for starting palm seeds. These boxes are much cheaper than if made by hand from sawed lumber or by dividing larger boxes into sections. Our system for the distribution and collection of tools, we find to give great satisfaction. We keep them under lock and key and depute a man to take care of them. He is not fully occupied at this and so finds other employment around the place. When a man wants a tool, he taps the bell which we use to summon and dismiss the men, and the man in charge of the tool house hastens to it and gives the man the tool he wants; when the tool is returned the bell is tapped again and the man comes and puts it where it belongs. By this system we have no trouble in keeping track of the implements and the least possible time is consumed in distributing and collecting them.

In sifting potting soil for small pots, we use an upright screen with a one-inch mesh, such as is used in coal yards, and find that it does the work as well and far more rapidly than a small circular sieve can do it. This season we had on trial a swinging sieve fitted up with iron teeth to break sods, but found it next to useless, although it is advertised with a guarantee to do the work of twenty men; it is fair to say, however, that the manufacturer supposed that florists still used the circular hand sieve, otherwise he said he would never give such a guarantee.

This season, on account of the very dry weather, we were compelled to water our outside grounds, almost constantly, and we used a device which worked satisfactorily and saved considerable labor. We use city water, metered to us, and have piped our grounds, thoroughly with hydrants at convenient distances throughout. Instead of having a man to hold the hose and distribute the water we used the device alluded to. This consisted of a Y piece inserted at the end of every twenty-five foot length of hose, one arm of which served as a connection between the lengths, and on the other arm we fastened a "Water Witch" lawn sprinkler. We use one-inch hose and have force of water sufficient to operate five of these sprinklers on one stretch of hose, so that we could water a surface of 125 feet by 12 without any labor but the stretching of the hose and turning on the water. About two hours we found sufficient to water one place, and then the hose would be moved. The location of hydrants is a very important one from a labor-saving point of view. In our 100-

foot houses, when first erected, we placed a hydrant at one end, but some years ago we changed the system and now have the hydrants in the center of the houses, one on each side of the middle bench. In our 300-foot houses we have the hydrants at intervals of 50 feet, and as just stated, our grounds are thoroughly piped and well supplied with hydrants. The amount of labor saved in one year by this method, I am satisfied, more than paid the entire expense of the alteration; besides the great saving in hose must be taken into account, which in itself is a considerable item.

It is of the utmost importance to keep a greenhouse watertight, not only to prevent rotting of the structure, but for the general health of the plants grown in it. We have found by experience that the lapse of time rots the putty in which the glass is imbedded, no matter how well it may be done, that water gets in, loosens the glass and rots the bars. Many devices have been tried to overcome this, but the best we have yet seen is one which was suggested to Mr. Charles Henderson at the Convention of the S. A. F. in Cincinnati by the late H. W. Williams, of Batavia, Ill. This consists of white lead and oil in about the consistency of cream spread in a thin line along the edge of the glass where it joins the bar; over this we shake dry white sand, the result is a cement which lasts for years and effectually checks all leakage. The best implement to distribute this is a machinist's oil can with the extreme tip cut off so as to widen the aperture and allow a free escape of the mixture. As an evidence of how rapidly this work can be done, I would state that two men finished the long slope of a 300-foot house in half a day. This method is described by Peter Henderson in his book "Gardening for Profit," and was made the subject of a magazine article, but I deem it of sufficient importance to introduce it here. Mr. Henderson stated that had he known of this method thirty years earlier, it would have saved him thousands of dollars for repairs, besides having the plants in better condition.

Before bringing this paper to a close, however, it may be well to devote a minute or two to a general review of the improvements effected during the last twenty years. The general application of the screw and cog wheel to ventilating, with its many improvements, replacing the rope and pulley and hand-lifting sash, and now we have an automatic ventilating apparatus which gives fair promise of becoming a practical reality. The great improvements made in heating apparatus, both hot water and steam; the improved glazing tacks and methods of driving them; the advance made in fungicides and insecticides and the improved methods of distributing and applying them; the diffusion of knowledge concerning the insects and fungi which are the most subtle and dangerous foes the florist has to contend with; the grand advance in greenhouse construction which I have already alluded to; the general substitution of horse and hand cultivators for the hand hoe; the use of steam pumps for distributing manure and plain water in many of our larger establishments; the use of printed labels both wooden and paper; the light and neat mailing boxes; the improved methods of packing plants; the general adoption of wire, cane and manufactured stakes in lieu of split shingle and branches of trees; the great general advance in plant knowledge and methods of culture—in all of which this Society has acted a prominent

part by bringing men together for a fair exchange of ideas, by establishing a press devoted to the general interest and by exciting a healthy competition. It is a matter of congratulation that the vast majority, nay, almost the whole of these improvements, owe their existence to men who were actually engaged in the active work of floriculture. We owe much to the entomologists and mycologists, those patient investigators who delve deep into nature's mysteries and lay the results of these investigations before us; we owe much to the men who have carefully and patiently studied how to improve methods of culture, who have spent time and money in their investigations and have scattered broadcast the knowledge laboriously obtained for the benefit of their struggling brethren. We owe much to the horticultural press for their enterprise and energy in obtaining and disseminating this knowledge; and we owe much to the faithful officers of this Society past and present, for the work they have performed in their official capacity.

BY ROBERT F. TESSON, ST. LOUIS.

[Read before the St. Louis meeting of the Society of American Florists.]

In accepting the request made by your executive committee to read a paper before you to day upon the above heading I did so with a feeling that there would be many members among you who are much more conversant with and better able to handle the subject than I. Still I also recognize the fact that when called upon to prepare something of this kind it becomes a duty that we should acknowledge and perform.

In treating the subject I will be forced to confine myself to the growing of the so-called tea roses, to the exclusion of the hybrid perpetuals, as I have had no experience with the latter class, and will give the results of observation as well as experience wherever they have commended themselves strongly enough to deserve a trial.

Science, in a general sense, may be said to consist of knowledge, or the understanding of facts by the mind. Science, therefore, applied to successful rose growing would consist of known facts, which from experience have been found to be essentially important in accomplishing the end the rose grower is striving to attain. This end, as I understand it, is the production of roses, good roses, and of the maximum quantity and quality, during the winter season. The statement of facts that are known to tend towards the accomplishment of the above results, or the science of it, brings me to the practical details connected with the subject.

To produce good results in any line of business or manufacture we must have good tools and materials to work with, and the same is emphatically true of rose growing. The houses should admit as much light as possible and be provided with ample openings for ventilation, even though they be used only during the warm summer months. The heating

should be so arranged that the temperature can be kept at 58° or 60° during the severe weather, I mean at night; it being useless to try and succeed where the glass goes down to from 45° to 50°.

To grow roses we must have plants and even before this cuttings, it being to every grower's interest to see that they start with clean healthy stock. Such when placed in the sand will root quickly and start off well when potted. There has been considerable written about cuttings, whether they should have one, two or three eyes, or whether better made with a heel. I am of the opinion, however, that provided the wood is in the same condition and receives the proper attention and care there will be little difference in the result obtained for the plants during the season. It is of much more importance to have the wood in the best condition rather than have a large number of eyes present. The cuttings should be made late in the winter and early spring months, according to the time wanted for planting, and placed in about three inches of sand having a bottom heat of 65° to 70°, with a cooler top, where they will root in from three to four weeks. As soon as the roots are from ½ inch to 1 inch in length they should be potted in 2½-inch pots; be careful to keep the air in the propagating house fresh and sweet by ventilating whenever possible, but avoid all drafts, as they are detrimental to the cuttings, especially so to Beanties.

The best soil to use for the first potting is well rotted sods, which if inclined to be heavy will be improved by the addition of some sand; manure of any kind in the soil at this stage is of no benefit; as soon as potted stage in a sunny house and see that the first watering is properly done, have all the soil moistened but avoid having it mud; shade for a few days until the roots take hold of the soil, after which gradually expose to the full sunlight. They can be kept warmer than the general run of stock, 80° not being too high on sunny days; give plenty of air but avoid drafts, syringe on all favorable mornings, and early every afternoon go over and attend to whatever requires water.

As soon as rooted through and roots commence to work around the sides of the pots enough to hold the soil together they should be shifted into 3-inch or 3½-inch pots, it being a mistake to wait until the plants are potbound before shifting, as they thereby receive a check. From these they should go into 4-inch and 5-inch if necessary; shift into the larger pots and use plenty of drainage rather than have them become potbound in the smaller size. Soil for everything but the first potting can be the same and should have about 1-6 part well rotted manure worked in as well as a good sprinkling of bone meal. Care should be taken at all times to see that the plants are not dry; some soils are quickly covered with a green scum which should be removed as often as necessary, it being impossible to tell the condition of the soil beneath it without knocking the plant out of the pot, and this is to be avoided as much as possible. I find the best time to look over pot plants to be early in the afternoon, as it is easier to tell then what requires water.

Planting should be done as early as possible, June being the generally accepted month. It is reasonable and should be understood that if we wish to cut a quantity of buds during the winter season we must have strong plants to do it from, and the only way to get strong plants is

to give them a season's growth. Those desiring to hold their roses in during June can accomplish nearly the same result by carrying their stock for replanting in 5-inch pots, thus having them well advanced when planted. The use of strong healthy stock and early planting is without doubt the most essential factor connected with successful rose growing, and if properly attended to renders the remaining work easy of accomplishment, while the use of poor stock gives the grower uphill work all the season and in the end is often unsatisfactory.

Before placing the soil in the benches see that they are well cleaned out and give a coat of crude oil or some other preservative. Any good soil will do, sod being preferable where it can be obtained. I have seen soil plowed to a depth of 6 inches and all of it used with excellent results. About 1-6 part of well rotted manure and a good sprinkling of bone meal should be well mixed with the soil before using, by turning the pile several times; a regular formula for mixing or composting can not be given owing to the wide diversity in the character of soils, but if inclined to be heavy an admixture of sand will be beneficial.

If the plants are strong place about 4½ inches of soil in the benches as it will settle to 3½ inches after having been there some time; should they be weak 3 inches or 3½ inches would be better; level the bed up as soon as planted and water so that all the soil is moistened; if the beds are inclined the higher portions will show a tendency to become dry as the top soil settles and becomes firm, this will necessitate stirring the surface. We use for this purpose a small hoe and attempt to go over the beds at least once every ten days, thus keeping all weeds down and enabling one at a glance to see the condition of the soil. The plants are syringed every morning during favorable weather, and what requires water is attended to early in the afternoon, the same as the pot plants. Stake as soon as possible; there are many ways of staking, but I prefer a single upright support to a plant, either a stake or a wire as may be most convenient; after being tied a light mulching is beneficial, as it prevents the soil from drying out too quickly and encourages root action towards the surface; as the mulch wears away a heavier coat can be applied, which should be continued during the season. As the plants gain strength and need food a liberal sprinkling of bone flour in the mulch will be beneficial.

Considerable has been written in regard to the advisability of carrying roses in shallow beds or on benches more than one season, and I think in the near future there will be much more written regarding it if the system is not more generally adopted; certainly if roses can be carried two and even three years in the same bed successfully there is considerable time and labor lost when thrown out yearly, as well as the saving in growing stock for replanting. Now, if as we all know there are places where this system is being and has been pursued successfully for years, we must lay the fault of various failures, not on the system, but on the persons carrying it out. There must have been a flaw somewhere, some detail that was omitted, or something that was not done properly. The method adopted is to gradually dry the plants off until they have had a good rest, without, however, allowing the bark to shrivel. You would be surprised at the amount of drying a rose plant can stand when done properly and still remain sound. After having

been rested, say two weeks, from the time water was commenced to be withheld all the small weak wood should be cut out and nothing left but the strong canes; these should be shortened back to about a foot or 18 inches. The plants are then watered and started into growth, a mulching of about an inch of composted soil is then spread upon the bed and they are treated the same as the young replanted stock; great care must be taken, however, in watering; owing to the lack of foliage very little water will be required. Syringing should be given every day, and in very warm weather a damping down in the afternoon is beneficial. As the new growth pushes out and the foliage increases they will require more water and should be watched closely, too much water will turn the foliage yellow and probably burn the edges of the leaves. Where solid beds are used the best results have been obtained where the amount of soil was very little more than that used in benches, say 6 or 8 inches. An old idea has recently been revived and tested in this connection with excellent results. It consists of the application of bottom heat to the soil in which the roses are growing by means of pipes passing beneath it; this allows the free syringing and watering during the short days of winter, the inability of doing which has led, in a great measure, to the abandonment of the old solid border.

It has been found advisable not to rest some varieties, such for instance as *Perle* or *Goutier*; they are better kept growing and in August having all the small wood removed, after which the heavy canes, instead of being cut back, are bent down, thus insuring numerous breaks. The objection to having them cut back close is their inclination to throw heavy stems terminating in clusters of buds, many of which are useless.

The manner of treating a variety with regard to drying off or keeping growing will have to be decided by the person in charge, forming their opinion from the style and habit of growth it presents. To make the resting of roses a success it must be done thoroughly and early in the season, so as to give them time to make their growth, the same as the young stock, before the short days of the fall season appear. I think *Brides* and *Mermet*s, in fact most all varieties, can be carried the second season in the same manner as *Perles*, simply by cutting out small wood in the summer; much care will have to be taken, however, with the watering. This plan I have never seen applied to benches, but will attempt it next season.

Manure water can be applied in the fall, provided the plants are as strong and vigorous as they should be, and can be used with advantage about every ten days or so during the winter season; should the plants not appear to be able to receive it to advantage it would be better to rely upon the mulching and what is in the soil to carry them through the winter months, commencing its use in January or February as the days begin to lengthen. At this time, too, plants that have been receiving it since fall can take it a little oftener, say about once a week, and will also be benefitted by working into the mulching some dried blood, ground tankage, or so forth. In applying liquid manure the beds should be in a condition to require watering, and it should be given thoroughly, so that it shows through the bench. A change in the ingredients is also beneficial, and soot, guano or other fertilizers may be used in turn. Where any large amount

is required it is a great advantage to have some place where it can be mixed in quantities and distributed wherever needed. The best thing to use for this purpose is an ordinary cistern, as it can be used at all times, being out of reach of the frost, and if large enough to hold a supply for two weeks a good day almost always occurs for replacing what has been used. Upon most large places some provision of this kind is made, but it could be done more generally to the advantage of all.

As fall approaches firing must commence, it being very poor policy to put this matter off too long; as soon as the temperature drops to 58° in the houses heat should be applied, even if the ventilators have to remain slightly open. I prefer a night temperature of 60° for most all varieties, and at times run it higher for a few days without any bad effects. The difference between roses grown at 60° and 56° is scarcely noticeable, while the quantity cut I think is increased. Firing should continue in the spring the same as in the fall, as long as there is danger of the temperature going below 58°. The necessity of firing in spring and fall is very often overlooked and is attended with disagreeable results.

Watering and airing are the two most essential factors in the growing of roses after they have been planted, and I wish some fixed rule could be laid down for the guidance of all, as here is where most failures are made, but it is impossible and the use of water must be regulated by the person having the plants in charge. I wish to make a distinction here in regard to watering and syringing. It is believed, in many places, that watering and syringing are the same, differing only in the amount applied. If they want to syringe the foliage is given a slight wetting; if they want to water the foliage is given a good wetting, enough falling upon the beds to constitute a watering. This is entirely wrong, as it is impossible to get the beds uniformly moist, or to pick out the dry spots while this system is pursued. A syringing should consist of a small amount of water applied with enough force to keep the plants free from spiders and to moisten and freshen up the foliage without having any amount fall upon the soil; when syringing is performed in this manner it is an exceptional day that it can not be performed and have the house dry by night. In watering the stream should be turned upon the soil and no attempt made to moisten the foliage; every bed should be carefully examined during the morning in the winter season and whatever requires water be given it. In examining the benches it is advisable to have a sharp piece of iron or wood, something with which you can go to the bottom of the bench to find out its condition, as the appearance of the surface will often mislead one. At times the benches will go several days without water, and again spots will be found that will require water for several days in succession, showing it to be imperative to examine them every day. I think a mistake is made very often by keeping the benches too dry in summer. The plants after having taken hold of the soil and with the amount of air given at that season can take plenty of water. It is an advantage to have the water used in the winter warmed to the temperature of the house, and if possible there should be some arrangement for doing so. Soils are different and require different treatment in regard to water as well as other matters, and it should be the aim of every grower to study and understand his soil

Air should be given upon all favorable occasions and as much as possible, avoiding, however, all drafts; too much air is as injurious as too little, and the knowledge and skill necessary to attend to it properly can only be acquired by practice and observation. During the summer they should have air day and night, as the cooler night air tends to toughen the foliage, rendering it more impervious to disease. During the winter months air should be given every bright day, even though heat is necessary to keep the temperature where required. During winter and spring it is a rare thing for us to have the heat shut off the houses during the day, even though there may be six or eight inches of air on at the time, thus air keeps the foliage strong and healthy. On bright days the temperature is kept at from 75° to 80°; on what may be called half-bright days, or times when it is hazy or cloudy, from 70° to 75° is maintained, and in dull gloomy weather 65° is carried. It will require considerable time to keep the air properly looked after, as it often requires shifting every half hour or so, but it will pay to attend to it properly, and in making a change it is better to go over it twice rather than make a big shift of it so as to save time.

Insects and fungus will think you have been fitting up a paradise for them and will proceed to locate if steps are not taken to check them. Mildew is best guarded against by watching for drafts, or anything that would tend to give the plants a check. In the winter sulphur applied to the heating pipes is the best preventive; in spring and fall powdered sulphur or fostite dusted on the plants will check its spread. Black spot affects some varieties of roses badly; keeping the house free from moisture during the night and the burning of all affected leaves will keep it in check. Red spider can only be fought with water, it should be applied with enough force to make the habitation disagreeable and he will depart; a dry, warm atmosphere is his delight and he can generally be found around in the corners where the air does not circulate or the syringe reach. Greenfly is probably the best known insect enemy of the rose and is very troublesome where given a chance; luckily, however, it succumbs to tobacco in almost any form, either the fumes when stems are laid in the houses or the smoke when they are burned. Lately an article known as extract of tobacco has been placed on the market and from experience in treating a house that was allowed to get pretty badly infested, so as to make a good trial, I can assure all it is a success. After the applications it was hard work to find a fly anywhere and it was six weeks before the house received another treatment. I feel confident that the extract used once a month will keep any place clean. The rose bug raised quite a noise some years ago, but since the practice of replanting stock every year has about become universal it is almost lost sight of, as it requires more than a season for it to do much damage; hand picking is the only safeguard. Thrip appear in the spring of the year and when they come it is in such numbers that they ruin a house of flowers in no time, they puncture the petals, causing the tips to turn brown. As far as has been learned nothing has any effect upon them, they hide around in the base of the petals where nothing can reach them; they come from the outside, as they can be found on the grasses and weeds as plentifully as in the houses. White grub often ruin whole benches of roses by eating off the roots. The best way to coun-

DWARFED JAPANESE MAPLES.

teract this evil is to carefully examine the soil and manure used for planting the roses in when turning it and kill all that are found; if during the summer you notice a plant hanging, while those around it are doing well, search around the roots and the chances are that you will find a grub there. Nematoids, the cause of club root, have only recently appeared in such quantities as to make them dangerous to rose growers. There appears to be no way to get rid of them after they are once established in the plant; the only safeguard is to treat the soil in some way so as to kill them before it is brought into the houses, either by spreading during cold weather so as to freeze it, or heating. I think probably as they exist on the living roots of plants piling the soil for a season so as to kill all vegetable matter might starve them out.

After having brought your plants into flower they will require cutting and sending to market; this is a branch of the work which requires the most careful attention, for if our output does not reach the market in good shape all hope of compensative returns for our work vanishes. The cutting should be done by a careful, painstaking person and should always be done by the same party, as different roses require to be cut at different stages of development, and these can only be learned by practice. Cutting should be done twice a day, morning and evening; at times, however, they will require attention and going-over at about 11 o'clock. After being cut they should be sorted and each grade placed separate; stand in a cool room or cellar with the stems in water until wanted for use.

In packing take care to have them properly placed, no crowding or bending of stems should be allowed, but they should be snug enough to remain stationary while in transit. It is a great advantage to have your stock make a good impression when unpacked, especially in times of an abundant supply. If soft paper is wanted use tissue manilla, avoid wax paper, as it bruises the petals. Have your stock graded into first and seconds, even though there be very few seconds. The advantage of having a uniform grade of goods and nice appearance has been

long recognized in other lines of business, but this knowledge seems to be sadly lacking in our own profession.

I would like to say in conclusion, systematize your work as much as possible; let each man have his allotted duties and hold them to their performance, attend to all details, see that nothing, however small a matter, is slighted, as the sum of small things makes success; keep your plants growing and avoid all checks, and much as we think we know about roses I venture to assert that no one as yet knows the capabilities or possibilities of the rose plant.

Dwarfed Japanese Maples.

The accompanying illustration is engraved from a photograph of two specimens of dwarfed Japanese maples for which we are indebted to Mr. Shibota Tomiyami, of Kobe, Japan, now at the World's Fair.

As noted the trees are kept in the form of a small bush. In many cases the tree is simply a stump with numerous different varieties of maple grafted upon it. In the miniature Japanese garden at the Fair is to be seen a maple of this form upon which no less than 24 different varieties have been grafted.

World's Fair.

During the past week there were some interesting gladioli to be seen at the Fair, though not as much in this line as one would expect. A pleasing exhibit of cut blooms was shown in the south curtain of the Horticultural Building by the Cushman Gladiolus Co., of Euclid, Ohio, including good blooms of familiar types. J. C. Vaughan made a display of gladioli and sweet peas in connection with his seed exhibit in the north end of the building, which brightened up the exhibit wonderfully, but these were all the cut blooms noted. Outside, however, in the beds north of the building, the new hybrid gladioli shown by V. Lemoine & fils, Nancy, France, are now in good bloom, and promise to continue for some time. They are remarkably beautiful; the rich colors, unique markings, and

broad spreading flowers are so distinct from the ordinary type. They are all the named sorts. Dr. H. P. Walcott is a light scarlet of remarkable size, a most beautiful flower; Jeanne d'Arc a light pink, slightly marked with sulphur; Beaurepaire a rich deep pink; Mme. Lemoine a remarkable primrose yellow, the lower petals stained with blood red. This was a particularly fine sort. Abbe Fraunte is a rich crimson, with a sulphur band across the lower petals; Vesuve, deep fiery red, the throat and lower petals deepening to black; Gil Blas, salmon, the lower petals marked with a butterfly of deep red and sulphur, unique; M. Leveque, deep red; Nuee bleue, deep rich heliotrope. Every variety is worthy of note, and their richness of tint and marking is incomparable. There is also a display of gladioli on the Island, where quite a quantity is in bloom in the rose garden.

In the Horticultural Building there are no recent additions, though some changes in arrangement are made from time to time. The E. G. Hill begonias, to which reference has been made previously, have been supplied with excellent labels, which leave nothing to be desired in the way of clearness. Among these plants is Count Louis Erdody, a noticeable sort marked by a strange peculiarity in the leaf. Instead of the leaf formation ceasing at the juncture with the stems it continues in a spiral form, giving the appearance of a little curl or rosette on the top of the leaf where it joins the stem. It is a handsome leaf, silver, with green nerves, and reddish border, and covered with strong hairs. Nickel Plate is another fine sort; leaf green and silver, the green border being covered with fine silver dots. Perle Humfeld is a large leaf, oddly splashed with silver. Inimitable is a large silvery leaf, very strong, covered with red hair. Anna Dorner is a fine acuminate leaf, green splashed with silver. Seedling number 83 is very large, color velvety green, with a broad silver band.

It is gratifying to note that the tuberous begonias continue to improve; those in the New York greenhouse are getting on very well, but all buds are removed, as soon as they show. There will be some beautiful lily of the valley to show the visiting florists; a quantity is already in bloom, being only about thirteen days in the sand, and is being kept in the coolest place to hold it back. Another lot is now started, and is expected in by the end of the week. These are some of Ernst Asmus' cold storage pips, and they are fine; not one in the lot has gone blind, and it is as fine a batch of valley as one could wish to see. It will probably be displayed under the dome. The glaxias are just about over.

On the Wooded Island the greatest show now is made by the varieties of Phlox decussata, which are blooming very profusely. Ellwanger & Barry have a fine show in their peony bed, the peonies, of course, being entirely obscured by the tall phlox. A mass of the beautiful white variety, Queen Marie, is very fine; the flowers are very large, pure white, and waxy in texture. It is a tall-growing sort and very free blooming. H. Cannell of Swanley, Kent, (England) now has his peony bed gay with phlox; Rea Bros., of Norwood, Mass., show some good sorts in their herbaceous beds, and there is quite a display in Pitcher & Manda's beds. Among them is a very good white, The Pearl; Mme. Moissette, a good pink with a darker eye, and Mrs. Goodwine, a deeper pink. In the German beds there is some good Drummond phlox, and one

bed filled with the oddly shaped Star of Quedlinburg is doing very well.

Among flowers now in bloom on the Island Pardonthus (Belamcanda) chinensis is flowering freely, and making quite a show; *Liatrix spicata* is covered with tall purple spikes, and a few larkspurs and harebells are still in bloom. But a good deal of the Island is showing the effect of the severe drouth; many shrubs are suffering, and a large proportion of the herbaceous plants and bedding. Artificial watering can never take the place of good rainfall, and this light hungry soil dries out quickly. Nor is it possible for the present force at command to manage so much extra watering. A day of steady rain would be a wonderful advantage.

How Can We Best Increase the Love of Flowers Among the People.

BY GEO. C. WATSON, PHILADELPHIA.

[Read before the Society of American Florists at the St. Louis Convention.]

With many enthusiasts in the florist business, working for an increase of a love of flowers among the people is a hobby quite apart from any pecuniary returns resulting therefrom, and it is safe to say that this missionary spirit is present in a greater or lesser degree with us all. When to this is added the fact that when such an increase is achieved the increased demand for our products increases our profits and the greater volume of business done improves the standing of the trade in the community, it is apparent why this question has such a vital interest for every one of us, and why we ought all to labor unceasingly to foster a love of flowers among the people—why we should think of it by day and dream of it by night, for there is both glory, honor and profit in the attainment of this noble and inspiring object.

The Society of American Florists was formed to further the interests of its members in every legitimate way, and if it can by any possible means increase the love of flowers among the people it will be doing the most effective kind of service. Indeed it is generally admitted that it has already been a powerful factor in this, although perhaps indirectly. The great extension of intercourse which this society has created among the members of the craft all over this continent; the improved methods of cultivation introduced by its discussions, and the consequent improvement in quality and lessening of cost of flowers and plants; the great and beneficial influence of its strenuous efforts for correctness in nomenclature; all these and various other influences directly emanating from the S. A. F. have undoubtedly done much to increase a love of flowers among the people. One of the first duties, therefore, is to strongly support the S. A. F. in the work that it is doing, and to give it individually all the assistance we possibly can.

The various florists' clubs scattered over the country are also a powerful factor, much in the same way as is the S. A. F. although within more prescribed limits. Every florist should belong to the local club, if there is one in his locality, and if there isn't he should set about forming one at once. It is the most astonishing thing to an onlooker to see the way the florists of some towns behave towards one another. Ten years ago it was worse than it is now; but there is a good deal of the old feeling still left in some localities. How much more sensible it would be, if instead of trying to cut one another's throats, each would join hands

with the other and spend their surplus energies in devising ways and means to induce their constituency to buy more flowers and plant more plants for the mutual advantage of all concerned. Too much competition is a bad thing; but if the competition is present whether you like it or whether you don't, the wisest thing to do is to make it as innocuous as possible. The way to make competition innocuous is not by cutting prices and trying to freeze the other fellow out. That plan hurts the one party about as much as the other. A better plan is to get together and try to devise a scheme for enlarging the market; to find out what each can grow best, and to endeavor not to be both hunting the same hare. The florists' club is the best agency through which to accomplish an object like this where concerted action is desirable. And don't think that because there is but a handful of you in the locality that a club is impracticable. The number is immaterial. Only get together, that is the main point. And don't sit down and wait for your neighbor to take the initiative. Make up your mind that you are going to do it yourself, and that you are going to get all the others interested, to help you. And don't give up because you find some that won't join in on the first asking. Don't be afraid of obstacles. Keep at it. The way opposition melts in the face of persistent effort is remarkable.

Besides being active in the S. A. F. and the local club, every florist should subscribe for and read carefully the trade papers published in the interests of the craft. One may read therein things he already knows; but that's nothing. He might also miss something he doesn't know, and it's a pretty smart man that knows everything. One cannot reach their full measure of usefulness in spreading a love for flowers among the people unless he keeps himself thoroughly posted as to what's going on.

Support the horticultural society. If you have not got such make it your business to form one. A horticultural society is instituted for the very purpose of spreading a love of flowers among the people. By support it is not meant that you are simply to join the society and pay your yearly dues. That is only *passive* support. Attend its meetings regularly. Be prepared to talk on interesting subjects connected with horticulture whenever there is a chance. Grow something for the exhibitions. Be prepared to sacrifice a little in the good cause, even if there be no great inducement in the way of money prizes for exhibits. If you have nothing worthy of entering for a prize, be sure you enter something for *exhibition* and mark it *not for competition*. And grow something a little bit out of the common for this very purpose. A novelty need not be an absolutely *new* plant. Anything good, if a little bit neglected for a year or two, will give almost as good results as a "Stanley's wash-tub" or anything else from outlandish places. Too many of us lay too much stress on the premiums. If we don't get first we sulk and kick and makes things generally disagreeable all around. We are too apt to forget that the best of judges are liable to err; that we can't all get the first prize; that our turn will come next; and that the prizes are a secondary consideration anyway in comparison to helping to spread a love of flowers among the people; and that our individual exhibit is perhaps doing more for the cause than some that have been luckier in prize getting on account of having a pot an inch smaller or something.

Endeavor to get all the wealthy people, as well as those not so blest, into your society. And when you get them impress upon them that they are *active members* and find ways for them *to be active*. Many who are members *now*, do nothing, simply because they don't know what to do nor how to do it. If you go to a man who is a member and who has a conservatory for his own pleasure and say to him that the society is desirous of making an exhibit of some particular class of plants a feature at its next show and that you want his assistance, ten to one he will gladly do what is required, and when his gardener goes to him about the same matter he will have no trouble in getting the requisite authority to go ahead. Without this little stimulation of the interest of the owner, a private gardener is often afraid to grow anything new of his own accord, and sometimes he thinks the prizes are not big enough; but if once he knows that the owner wishes it, the prizes become a secondary consideration. Being a member of a horticultural society implies a certain amount of obligation to further the interests of the institution, and it should be firmly impressed on each and every one who joins, that he or she is expected to become an active worker, and the executive should see to it that *some duty* is entrusted to them at as early a date as possible.

Train the young. Much has already been said at previous conventions on this; but it is of such importance that it cannot be too often insisted on in any effort for the advancement of horticulture. The Massachusetts Horticultural Society, the Amateur Gardener's Society of Springfield, Mass., and perhaps some others have a department specially devoted to this purpose, and it should form a part of the work of every horticultural and kindred society in the country. The impressions received in childhood are deep and lasting, and we are derelict in our duty if we do not make every effort possible to foster a love of gardening in the young. Many Sunday schools make a feature of plant and flower growing and exhibiting same. These deserve every encouragement. Something might be done with the public schools.

[CONCLUDED NEXT WEEK.]

The Horticultural Congress.

The following is the outline program so far as arranged for the General Horticultural Congress to be held at the Art Institute, Adams street and Michigan avenue, Chicago, beginning August 16th and continuing three days:

GENERAL SESSION, WEDNESDAY, AUGUST 16, 10 A. M.

Technical Horticultural Education. Prof. Wm. Trelease, of Missouri Botanical Gardens.

Improvement and Care of Public Grounds.—Developing and Conserving Natural Beauty. Wm. McMillan, Buffalo Parks.

Relation of Experiment Stations to Commercial Horticulture. Chas. W. Garfield, of Michigan.

Horticultural Displays at Future World's Fairs. Prof. Dr. L. Wittmack, Berlin, Germany.

Horticulture and its General Relation to Art.

SEEDSMEN'S SESSION, THURSDAY, AUGUST 17, 10 A. M.

Pedigree, or Grade Races in Horticulture. Henri L. de Vilmorin, Paris, France.
Seed Growing in Denmark. J. Pedersen-Bjergaard, Copenhagen.

Comity in the Seed Trade. Jas. J. H. Gregory, Marblehead, Mass.

Knowledge in the Seed Trade. E. V. Hallock, Queens, N. Y.

Selection in its Relation to Seed Growing. C. L. Allen, Floral Park, N. Y.

American Seed Growing. C. C. Morse, Santa Clara, California.

NURSERYMEN'S SESSION, THURSDAY, AUG. 17, 10 A. M.

General.

Japanese Nurseries, Dwarfing of Plants and Miniature Gardening. Henry Izawa. Interstate Laws to Control Insects and Diseases. Edward Willets, John Rock.

Forestry and Nursery. Heir Runnebaum, Eberswalde, Prussia.

Specific.

Present Status of the Nursery Trade in Europe. Victor Lemoine, H. Waterer.

In Our Own South.

In Mississippi Valley.

On Pacific Slope. W. R. Williams, Seth Llewellyn.

History of Nursery Business in America.

FLORIST'S SESSION, THURSDAY, AUGUST 17, 8 P. M.

Address of Welcome.

The Past of Floriculture. Prof. G. L. Goodale, Cambridge, Mass.

The Present of Floriculture. Robert Craig, Philadelphia, Pa.

The Future of Floriculture. E. G. Hill, Richmond, Ind.

Hybridization and the Benefit Accruing to Horticulture. Prof. Chas. Naudin, Antibes, France.

How Best to Subscribe and Protect the Interests of the Originator of New Plants. Luther Burbank, Santa Rosa, Cal.

The Packing and Shipping of Plants.

The Utilitarian Advantage and Importance of Floriculture.

POMOLOGIST'S SESSION, THURSDAY, AUGUST 17, 8 P. M.

General.

Amelioration of our Native Fruits by Artificial Crossing and Selection.

Location and Environment as Affecting the Evolution of Fruits. G. B. Brackett, Iowa.

Mediterranean Fruits.

Catalogues and Nomenclature. T. T. Lyon, South Haven, Mich.

Specific.

Our Citrus Belts.

Commercial Apple Culture.

Peach Areas and Problems.

Vine Culture and Products. Geo. Snow, New York; Geo. W. Campbell, Delaware, Ohio.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By experienced rose grower, single; best of references. Address: E. S. E., 424 Washington St., Brighton, Mass.

SITUATION WANTED—Indiana preferred; commercial or store. Good all round man; single; references. Address: J. H. Pequannock, N. J.

SITUATION WANTED—As foreman in commercial place; age 30; married. First-class references. Address: ROSKIN, box 61, Providence, R. I.

SITUATION WANTED—By a good florist as foreman or assistant—commercial place preferred. Many years' experience in the business. Good recommendations. Address: W. F., care Am. Florist.

SITUATION WANTED—By a single Scotchman; age 30 years; is a first-class propagator and grower; would like to negotiate with party requiring the service of same. Competent to take charge if wanted. Address: GROWER, care American Florist.

SITUATION WANTED—A Hollander 24 years of age, having several years' experience in Holland in gardening, planting of trees and flowers, laying out of gardens, etc., desires situation. Best of references given. Address: HOLLAND, care Am. Florist.

SITUATION WANTED—As manager or foreman in a large commercial place; thoroughly posted in the growing of roses, carnations, violets, chrysanthemums, decorative and bedding plants, the forcing of all kinds of bulbs, making up, etc.; 21 years' experience; single. Good testimonials. State wages, etc. FLORIST, 41 Steinway Ave., Cleveland, O.

SITUATION WANTED—By single, young, practical florist and gardener; wide experience in both branches. Also in mushroom culture, fruit growing and landscape work. Life experience. Last 5 years as head florist and gardener in large public institution. Not afraid of work. Best of references. Prefer a private place. Address: H. SWABY, box 56, Clifton, Green Co., O.

WANTED—A handy man to take charge of mushroom cellars. Inquire for particulars at once. Address: HERMAN CLAYSEN, Gypsum, Ottawa Co., Ohio.

WANTED—A good all round, married man to grow roses, carnations and violets for retail trade. A sober, pushing man of experience. State wages wanted with house. M. J. LYNCH, Poughkeepsie, N. Y.

WANTED—A commercial traveler for the United States, on 10 per cent. commission, for one of the oldest and best nurseries of Ghent, Belgium. Address with references: E. V. C., care American Florist, Chicago.

WANTED—Young, single man; must have experience in growing roses and carnations; must know something about design work, and speak English and German. Good wages and steady work for the right man. Apply to: A. KLOKNER, 219 Grand Ave., Milwaukee, Wis.

Address THE AMERICAN FLORIST CO., Chicago.

New York.

The James Taplin greenhouses at Maywood, N. J., are now closed. Mrs. Taplin retiring from business. It is doubtful whether the place will again be occupied by a florist's business, as property in that vicinity is now very desirable for residence purposes. Jas. S. Taplin, who had charge of the business as administrator, goes to Madison as foreman for T. J. Slaughter.

YONKERS, N. Y.—A chrysanthemum show will be given here October 31 to November 4 under the auspices of the Yonkers Teutonia Society. The premium list has been printed and copies may be had on application to Mr. John Beattie, manager of the exhibition, Riverdale, New York City.

BLOOMSBURG, PA.—The wife of Mr. J. L. Dillon died July 30, aged 44 years. She had been an invalid for about ten years, but until the last two years had been able to attend to her household duties. Her husband and two children survive her. Mr. Dillon will have the sincere sympathy of his many friends in the trade in his bereavement.

TOPEKA, KANS.—In the future the business formerly carried on by the Boneita Greenhouses will be done by the Bates Floral Co. To meet the demands of their growing business more houses were needed, so Mr. W. L. Bates' father, Mr. Geo. P. Bates, took an interest in the concern and advanced the money to make the needed improvements. They have leased a building in the city and about September 1 will open a downtown store.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

J. C. VAUGHAN, Chicago, president; A. L. DON, New York, secretary and treasurer. The eleventh annual meeting at Chicago, August 14 to 16, 1893. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Onion Sets, Philadelphia Crop Reports.

The following notes will be of interest as showing the state of the crop in this section. One of the largest handlers says: "We think the indications are that crops of onion sets are very short in this immediate section. The sets as a rule are small and excellent samples but are not turning out the bushels as in former seasons."

Another big operator says: "The onion set crop in this section is short of the average; many fields have been sadly damaged by maggot, while the excessive dry weather in the latter part of the season has reduced the crop in a material degree."

Another report is even more discouraging: "So far as we can learn of the crop in this section it will be very short indeed; do not think half a crop will be realized. Many growers have informed us that they will not get back the price of their seed. High prices will rule of course. We think when all reports are in it will be the lightest crop in many years."

Chillicothe, O., reports about two-thirds of a crop.

Chicago reports about same yield as last season and of better quality.

THE LOHRMAN SEED CO., of Detroit are succeeded by Lohrman, Brotherton & Co., Mr. Phillip Breitmeyer being admitted as a special partner.

MR. ENOS S. HARNDEN, the new special agent for the Government Seed Department, is reported to have so far saved the government over 25% on purchases he has made.

THE American Pomological Society has issued a circular announcing that it is deemed inexpedient to hold the regular biennial session at Chicago August 16 to 19 as had been intended, and the executive committee has therefore decided to call a social reunion of the members to convene at the Art Palace on the Lake front, Chicago, at 4 p. m. August 17, 1893, when the time and place for the next regular biennial session will be agreed upon. The members are urged to be present during the sessions of the Horticultural Congress, August 16 to 19.

HENION & HUBBELL, 55 N. Clinton St., Chicago, Ill.

Philadelphia.

A meeting of the creditors of La Roche & Stahl was held Friday afternoon August 4, in the office at the greenhouses at Collingdale, Delaware county. Over seventy florists were present. C. D. Ball of Holmesburg was elected chairman and Robert Kift secretary. The meeting was called by Messrs. La Roche & Stahl to make a statement of their assets and liabilities to the creditors and present a plan for paying off their indebtedness.

Mr. La Roche stated that they had prepared a statement of their assets, but he could not just lay his hand on it at present, but he gave a verbal list which was copied down by the secretary, and was as follows:

Greenhouse property sixteen houses.....	\$17,000
Real estate on which they stood	15,000
Office, potting shed, wagon shed windmill.....	5,325
Horses, wagons, carts, etc.....	2,000
Store fixtures and stock 13th and Chestnut.....	550
Book accounts.....	5,000
Merchandise and stock in greenhouses.....	15,000
Sash on place.....	225
Total assets, greenhouse and store.....	60,100
Mortgage on greenhouse property.....	11,000

49,100

Other assets were equities in building lots and some mortgages..... 43,200

Total assets..... 92,300

The liabilities as per judgment confessed to the trustee, and on which execution was taken footed up to \$71,328.65. Of this amount \$22,000 in round numbers is due to one hundred and forty-five florists, while nine other creditors, prominent among whom are national banks who hold nearly fifty thousand dollars worth of the firm's paper, represent the balance.

The florists' claims run from a few dollars up to \$1,600, this being the largest amount due any one creditor; there were quite a number of claims noticed above \$300 in the list which Mr. La Roche read at the request of one of the creditors.

Mr. La Roche then presented the proposition or settlement which they desired to make with the florists. He said they must have time, that if the sheriff's sale under the execution was allowed to go on, probably not more than half the amount of the valuation of the assets would be realized, if that much. The proposition of the firm was that they pay five per cent. of each claim semi-annually from date of judgment, July 24, as well as interest at six per cent. until all indebtedness was paid, which practically meant an extension for ten years.

Immediately after the proposition J. B. Candy of Langhorne, Pa., moved that it be accepted provided the banks would agree; the motion being seconded, was put to the meeting and passed unanimously without any discussion whatever. A poll of those present was then taken and a committee appointed to confer with the banks at a meeting to be held August 7. H. P. Michell, Charles Meehan and John Smith comprised the committee, and were given power to act. After an adjournment to the greenhouses the meeting reconvened and some questions were asked Mr. La Roche, the principal one being by George Anderson, it was "Could the members of the firm

BAY STATE HARDWARE CO.
272 Freeport Street, BOSTON, MASS.

pay off a dissenting creditor?" Mr. La Roche said that they had the right to pay any individual if in their judgement they could do so and still carry out their agreement with the other creditors. After partaking of a lunch the meeting adjourned and a rush was made for the train then due. The whole affair passed off as pleasantly as possible, and a prospective bowling match or last day of the convention could not have found the boys in better humor.

W. S. Delaney was taken suddenly ill on the street last Friday afternoon and almost immediately expired; heart failure was the cause of his death. The deceased for quite a long time had been solicitor for the Pennsylvania Horticultural Society, but about a month ago resigned on account of failing health. He also filled the position of ticket seller at the exhibitions, and Mr. Cartledge the treasurer says that it was a pleasure to audit his accounts, in which he had never found a single mistake.

There is nothing new in the way of business, the rule being that it is a long while between customers. K.

Chicago.

The flower trade is very quiet now, and most of the retailers complain of general dullness. It is hard to quote prices with any exactness, since they fluctuate from day to day, but there is little change since last week. Some few excellent roses are to be seen but the prevailing quality is indifferent. Some good Beauties are seen, also Perles, but most roses are small, even where the color is fair. Carnations are the only flowers now scarce, and they are poor too. Asters are quite plentiful; the most salable colors are white and pink, the darker tints are not liked. Sweet peas are falling off, and many are evidently coming to the end of the crop. There is some sale for the white ones, which are used in funeral work during the scarcity of carnations. Gladiolus and auratum are both plentiful, but there is little longiflorum or valley. Dahlias continue to come in, and the bulk of the material is from outside.

At a meeting of the Executive Committee of the Horticultural Society held last Saturday afternoon a committee was appointed to arrange for a banquet to the distinguished visitors who will be in the city during the Horticultural Congress. The event will probably take place at one of the well known clubs of which President Chadwick is a member.

Visited Chicago: W. G. Berterman, Indianapolis, Ind.; Lendel V. Hallock, Queens, N. Y.; Wm. Plumb, West Atlanta, Ga.; E. Hippard, Youngstown, Ohio; L. W. Lozier, Des Moines, Iowa; Jas. Eadie and Miss J. Eadie, Cleveland, O.; A. H. Graham, Cleveland, O.; H. A. Hart, Cleveland, O.; Chas. Koeppen, Sedalia, Mo.; Mr. Knott, of Franklin Park Floral Co., Columbus, O.; Frank W. Sherman, Traverse City, Mich.; Thos. Giherson, Cedar Rapids, Iowa; Willie Bruce, Hamilton, Ont.; I. N. Kramer, Marion, Iowa; Mrs. Paul Brooks, Lawrence, Kan.; Wm. Clark, Colorado Springs, Col.; Chas. Warneke and family, Detroit, Mich.; Mrs. W. Hughes and daughter, Hillsdale, Mich.; Fred Foster, Milwaukee, Wis.; Messrs. Hogg & Son, Detroit, Mich.; G. M. Bird, Sidney, O.; M. P. Dilger, Waukegan, Ill.; Chas. Rauss, Detroit, Mich.; A. F. Breitmeyer, Detroit, Mich.; J. M. Gasser, Cleveland, O.; J. G. Esler, Saddle River, N. J.

The Chicago party for the St. Louis convention numbered 35 including visitors from other points, among which were Geo. Nicholson, Curator of the Royal Botanic Gardens, Kew, England; Prof. Dr. L. Wittmack, Berlin, Germany, Rob't. Craig, Philadelphia; W. H. Elliott, Brighton, Mass.; D. B. Long, Buffalo; E. H. Krelage, Haarlem, Holland; J. G. Esler, Saddle River, N. J.; J. M. Gasser, Cleveland, O.; A. Wiegand, Indianapolis; A. R. Congdon, Oberlin, O.; E. Wachen-dorff, Atlanta, Ga.; Chas. Dannacher, wife and daughter, Davenport, Ia.; J. Deake and wife, Asheville, N. C.; A. J. Wagner, Fort Wayne, Ind. Uncle John Thorpe was in the party and with the assistance of Mr. Craig and the "only" Walter Kreitling, kept things from stagnating on the trip.

TO STOTT GARDEN IMP'T CO.,
136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmicht for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed BOLANZ BROS., Akron, O.

See Special Offer Aug. 3 and 17.

PANSIES.

THE BEST ARE THE CHEAPEST.

SIZE is a strong point in Pansies; when you combine size, color, substance and form they are pretty near right. By careful hybridization and selection I have accomplished this, and the Pansies I send out this Fall will be an agreeable surprise, even to former customers. If you buy Pansies I would be pleased to correspond with you; they will be offered for sale from Aug. 20th to Dec. 1st, at 75c. per 100 or \$5 per 1000. Terms cash with order or C. O. D. No seed for sale.

L. B. 496.

Foreign Notes.

Lilium crocea-elegans is a new hybrid, the result of a cross between *L. croceum*, a European variety, and the Japanese *L. elegans* (Thunbergianum,) originated by Mr. Sprenger of Naples. It is robust in growth, the stem reaching a height of two feet or over. The inflorescence consists of six or eight flowers in a loose corymb, the flowers bright scarlet, with many small black dots. It is very ornamental.

Adiantum venustum is a handsome cool-house fern, which should be useful for cutting, as the fronds are harder than most of the maidenhairsts. The fronds are about a foot long, with finely toothed pinnules.

Epidendrum Wendlandianum is a new orchid from Mexico; the flowers are produced two or three on a stalk, the petals and sepals light green, the lip snowy white, with dark purple lines on the side lobes; the column is also purple. The diameter of the flower is nearly two inches. It blooms in midsummer, and thrives in a cool house.

Two new caladiums, recently introduced from Brazil are *C. venosum* and *C. rubescens*. *C. venosum* has petioles eight to ten inches long, light green, densely covered with dots and lines of black. The leaves are seven to ten inches long, three to four inches wide, dark green, the course of the nerves variegated with light yellowish green, the margin narrowly edged with red. *C. rubescens* has petioles five or six inches long, blackish, leaf five to six inches long and two inches broad, with wavy margins. Upper surface crimson, with green border. These caladiums, while quite distinct in character from any others in cultivation, are regarded as being nearly related to *C. Schomburgkii*.

Baltimore.

The weather is too warm for exertion, and yet the scribe has just exerted himself, and consequently has to still further exert himself to keep cool, i. e., to prevent his temper from rising and all on account of a piece of advice he took, or tried to take. The advice was about as follows: "When you tie up your new beds of smilax and asparagus, don't use the common white string. Use shoemaker's dark green thread; it is strong and invisible. You can buy it at any shoemakers supply store." What could be more to the point, better expressed or more timely and practical? At least so he thought, and as he had both old and new beds requiring string, he blithely ordered his driver to purchase a lot, and pictured himself draping chandeliers, mirrors, etc., with no vexatious delays incident to removing thick, and possibly knotted string. Alas! the driver reported that he couldn't get it. Then despite the heat, the "boss" himself started out on a quest for dark green shoemaker's thread, which speedily came down to a quest for grass green, apple, pea, Nile or any other green, and not only run through shoemakers supply stores but harness and notion stores as well, with the result that this evening he is willing to bet that such a thing as green shoemaker's thread is not to be had in all this great city, and he has very serious doubts—but, there, it is too warm to carry the theme any further; suffice it to say it will be a cold day when he goes hunting green shoemaker's thread again.

Flowers continue to sell in a deliberate, and leisurely sort of a way. No doubt much that is purchased by the retail stores goes to waste, but appearances must be kept up, or nothing will be done at all, and the stores that keep up the best appearance seem to do the best these dull times. Whether the show is the cause or effect of the sales who can say?

Prices remain about as before, with choice white and yellow buds in good demand; in fact good white flowers of all kinds are pretty sure sale.

Mrs. Mary Johnson, nee Patterson, has just returned from a trip to Atlantic City.

The members of the club who are going to the convention will go via Philadelphia, as the rates seem more favorable, and the genial company which they will have from there on will enliven the journey. MACK.

S. A. F. Officers Elected.

Officers for 1894 were elected as follows: President, J. T. Anthony, Chicago; Vice-President, Robert Kift, Philadelphia; Secretary, Wm. J. Stewart, Boston; Treasurer, M. A. Hunt, Terre Haute, Ind. Atlantic City, N. J., was selected as the place for holding the next convention.

THE FIRST VOLUME of the FLORIST contained 438 pages; the last volume contained about 1,400 pages, a gain of nearly 1,000 pages. Do you know of any book containing 1,400 pages that you can buy for \$1.00?

WE SHALL PRINT in next issue Mr. Craig's essay on the past and present of floriculture, in addition to other essays read at the horticultural congress. We shall also give a full report of the reception and banquet tendered to distinguished visitors by the Horticultural Society of Chicago, at the Union League Club, August 18.

Convention Notes.

The number attending the convention at St. Louis was the smallest for several years. The evening sessions were rather slimly attended and the small number of ladies present was frequently commented upon. But, on the whole, the meeting was a successful one, and the report, when completed, will read well. The new arrangement of the program to accommodate the auxiliary societies and give them an opportunity to present their plans before the larger society was not much of a success, and with the exception of the two splendid essays delivered on behalf of the Carnation and Chrysanthemum Societies little work was done by any of these organizations.

The election of president was the occasion of quite a discussion, which resulted in the postponement of the final election until Friday evening, when J. T. Anthony was elected president and M. A. Hunt treasurer, Robt. Kift having been elected vice-president and Wm. J. Stewart secretary at the morning session.

An invitation having been extended to the visitors to visit the establishment of the Anheuser-Busch Brewing Association a large number availed themselves of the privilege on Friday afternoon, and while there were lavishly entertained.

The Question Box was an interesting feature of the meeting on Friday evening. To the question, "In heating with hot water under pressure, what size of pipes and how many are required to heat a house 20x200 to 60° when outside temperature goes as low as 28° below zero?" Ernst Asmus replied as follows:

"The question is rather indefinite, as it does not state what kind of a house, whether a lean-to, even-span, or three-quarter span, or whether it has glass on sides and ends, nor does it say how much pressure is wanted, all of which makes a material difference when figuring to pipe a house satisfactorily. Taking for granted that the questioner meant a three-quarter span house with glass on roof, front and one end, I would use twelve rows of two-inch pipe under a pressure of fifteen pounds, and I will guarantee to keep 60° or more with a suitable boiler and a good fire of good Lehigh coal, if the outside temperature goes as low as 30° below zero. I have houses of the above description of nineteen feet width, in which I use only nine rows of pipe, and I have never seen the time when I could not keep it up to 60° under the coldest weather in this latitude, which was 14° below zero last winter."

After the reading and acceptance of the report of the committee on nomenclature, the following resolution was unanimously adopted:

Resolved, In view of the recommendations of the Nomenclature Committee, that a committee of three be appointed by the chair, the secretaries of the Chrysanthemum, Carnation and Rose Soci-

ties also to act as members, to prepare a list of decorative plants handled by the American trade, for consideration and adoption as the official list of this Society; said committee to act under the following general instructions:

1. Natural species and varieties shall bear the Latin names assigned to them in Nicholson's Dictionary, so far as they are named, except that where differences exist between the Dictionary and the Kew Index, now in course of publication, the name adopted by the latter shall be chosen. Species first published or reinstated subsequent to the date of the latter (1885) shall be treated in accordance with botanical custom, especially that of the Kew Gardens. In all cases in which the application of this rule shall cause the displacement of a commonly used and well known name, the latter shall be added as a synonym.

2. Florists' varieties, races and forms shall be named in accordance with the recommendations of the Nomenclature Committee this day submitted; but the greatest conservatism is counseled in all changes which are likely to cause confusion or detriment to legitimate business interests.

A very pleasant feature of Friday evening's session was the presentation of a handsome water pitcher, tray and goblets to ex-President Jordan, and a gold watch and chain to President Smith, speeches appropriate to the occasion being made in the first case by Robert Kift, and in the latter by E. H. Michel; both the recipients being taken completely by surprise. Mr. Jordan replied in a few words expressing his deep appreciation of the kindly feelings manifested toward him, which he claimed he had done nothing to merit, and thanked the donors over and over again.

President Smith responded in tones tremulous with emotion. He said: "Mr. Michel, ladies and gentleman, the trying position in which you have placed me almost prevents me from saying anything. Did I utter the feelings of my heart you would be agitated as much as I am, but I have not the voice to do so. There is nothing that I will cherish through life like the present you have given me. There are no words at my command to express to you the depth and sincerity of the grateful feelings which overwhelm me at this moment. I can only thank you from the bottom of my heart and assure you that I will treasure this occasion as a lasting and delightful memory forever. Permit me to say that one of the grandest and best agencies for elevating our profession is the one to which I am indebted for whatever distinction has been accorded me in my profession. I allude to the educational establishment of which our distinguished guest, Mr. Nicholson, the Curator of the Royal Botanical Gardens, Kew, is the representative. It would have pleased me much if that gentlemen could have been present this evening to see how the young men of America have honored one whose early training was received in that establishment. I wish to say further that it has been to me a gratification and delight to meet you all here, and my visit to St. Louis will be remembered among my red letter days on earth. I have seen on all sides the genial faces and

the outstretched hands of kind friends; and in our mutual enjoyment and delight we have had a foretaste of that higher sphere of happiness which we all expect to reach in the great hereafter."

On Saturday afternoon about one hundred of the members visited the country residence of Mr. D. S. Brown by special train which Mr. Brown had kindly provided, and spent a very pleasant hour inspecting the grand collection of decorative plants, orchids, etc., to be seen there. On Saturday evening the final attraction of the convention, the illumination of the streets of St. Louis, by the Autumnal Festivities Association. This feature was a great surprise, far surpassing the expectation of all, and it was remarked by many that this alone was well worth the trip to St. Louis.

The committee on final resolutions thanked the florists and citizens of St. Louis for their cordial hospitality, Mayor Walbridge for his hearty words of welcome, Prof. Trelease and the trustees of the Botanical Garden for their entertainment at the garden, the St. Louis Florists' Club for its kind assistance in the work of the convention, for the carriage ride, and many other hospitalities, the Pastime Athletic Club for the use of its bowling alleys and other privileges, the Anheuser-Busch Brewing Association and Mr. D. S. Brown for their kind attentions, and expressed on behalf of the society their sense of obligation to Messrs. Nicholson, Wittmack, Lemoine, and others, for honoring the society with their presence.

Friday evening Prof. Wm. Trelease invited a few friends to dine with him at his residence in the Missouri Botanical Garden. The party included Messrs. Geo. Nicholson, Robt. Craig, Wm. R. Smith, W. A. Manda, Fred Kanst, John Thorpe, J. C. Vaughan, M. Lemoine, E. H. Krelage, E. G. Hill, A. T. De la Mare and G. L. Grant. The affair was strictly informal, the dinner was excellent, and all present enjoyed themselves heartily.

"I Want to Know?"

New York.

Certainly they celebrated.

Yes, it was a scrub team.

Yes, they did it without the "big fellows."

Oh, no, Philadelphia did not want to win this year. "This makes it more interesting, you know."

Why, yes, the New Yorkers were somewhat hungry when they reached St. Louis.

Of course! The Philadelphians did crow considerable because they didn't miss their supper.

Yes, they would have given up their suppers for a week if by so doing they could have captured the St. Louis cup.

No, not one of the Buffalonians got out in the morning to see the New York and Boston delegation as they passed through.

Yes, Phil Breitmeyer was on hand at Detroit with a hearty hand-shake and welcome.

It was E. G. Hill who said that we might as well shut up shop as to try to run a flower show without the help of the newspapers.

Yes, the address of welcome by the Mayor of St. Louis was one of the best speeches ever listened to by the society.

True, alas, too true, it was Geo. Watson who defended the catalogue men, exaggerated illustrations and all.

Well, yes, the New Jersey men think that Philadelphia did commit piracy in appropriating Atlantic City.

No, the captain of the scrub team did not find any twin mosquitos.

Yes, John Thorpe's dog learns a new trick every day.

Sure! The Anheuser-Busch trip.

Yes, plenty.

Benefits of a Closer Co-operation between Growers and Retailers as Regards Regulating Prices.

BY ROBERT KIFT, PHILADELPHIA.

[Read before the St. Louis convention of the Society of American Florists.]

There is no system so perfect that it is not open to improvement, and the loud complaints that are constantly heard show that growers and dealers are much dissatisfied with the present methods of marketing cut flowers. It is a very slow season indeed that does not hatch out one or more schemes having for their object a more perfect system in handling flowers and regulating prices.

Perhaps it would be well to take a general view of the situation. One retail dealer will buy the great bulk of his stock directly from the grower, making in some cases contracts for the entire crop. He will be heard to declare that this is the most satisfactory way of doing business, and he wonders how anybody can be so foolish as to pay outside prices to a commission man, when he can get flowers so much cheaper by dealing directly with the grower.

A season or two passes by, and the same dealer is found to be a regular customer of the commission man, and now firmly believes that this is the system by which all flowers should be handled in a wholesale way. He will say, "You see, when I contracted with Brown his flowers were the best in the market, and he sent in just about as many I could use, but after a while the stock commenced to pile up on me so that I couldn't possibly use it all and the bills were something frightful. In cold weather, when flowers were scarce, I didn't get enough and had to go outside and pay high prices. Finally my experience was that when flowers were most in demand I did not get enough, and when the dull season set in I had more than I knew what to do with. This is the reason I made the change."

On the other hand a certain grower ships all his products to be sold on commission; he says it is the only way. He has tried the retail dealer, but has no use for him. It was all right at first, when flowers brought a good price and he could sell them anywhere; in fact men came to the place after them. Then everything was lovely, but after the crops were in full swing and flowers began to get plentiful he would get all sorts of complaints from the dealer and finally have the crop thrown on his hands when there was little or no market for it.

Another grower we find with his gun loaded for the commission man; he says he is a rascal, a cheat and a fraud. As

long as flowers were scarce he got a fair price, but after they became plentiful his returns were hardly sufficient to pay the expenses of shipping. He had known of certain consignments of his being entirely sold almost as soon as they were offered for sale, but finding no evidence of this among the returns he was told, after demanding an explanation, he had to divide up with others, whose stock, though as good as his, had gone to waste.

These and similar complaints are to be heard from both sides. Occasionally growers are met who say they are very well satisfied with the way their stock is handled, and there are dealers who, thinking they have a kind of monopoly of the best flowers, prefer the system prevailing in their locality and are opposed to any plans for its improvement.

I believe the entire solution of this vexed question lies in the establishment of a flower market in every large city. This can be done by the co-operation of the commission men and the growers. Let them have all the flowers grown about any large city offered for sale in one place or market early every morning, and they can depend upon it the retailers will do the rest. Cut flowers are a perishable stock, and have to be handled in such a way after they are cut as to reach the dealer with the least possible delay, and I fully believe that in no way can this be done better than by sending them to a common center from which they can be selected. In such a place the grower and the dealer or their representatives meet and the question of regulating prices is soon settled. Combinations to regulate prices almost invariably fail. They may succeed for a time, but finally the projectors find that what they make by the combination is eaten up in the cost of running the machine, which soon breaks down and is found to be beyond repair.

Prices regulate themselves. If buyers are plenty and flowers are scarce the price goes up; it cannot be kept down. The dealer must have stock for his customers; he will even buy that which he has little demand for in order to get a popular flower of the season, as "You cannot have my Beauties unless you buy something else" is a very familiar expression to retail men.

On the other hand, when flowers are plentiful prices fall just as naturally as water runs down hill. Try to stop them and you have a dam, an additional load to carry, but if the price is kept at even pace with the current all will be well and things will run on smoothly as before.

The establishing of a market does not mean that the commission merchants are to go out of business; by no means, they are to be part, and a very large part, of any such corporation. The growers or their men, who waste valuable time going from one store to another, littering up the dealer's counters with their boxes and baskets when he is busy are also to be a part of the market.

And lastly the dealer, who waits for Tom, Dick and Harry to come in with their flowers in the morning and stands impatiently looking at the clock, and every few minutes steps to the door to see if Jones, who should have been there an hour ago, is not coming with his Brides, and finally sees his would-be customer obliged to go to make a train without being served. He is to be there, yes, make no mistake, he will be there; his men will be found early in the morning waiting for the stock to arrive. The 34th street ferry market in New York opens at 5 a. m. and the business is all

GROUP PHOTOGRAPH OF THE S. A. F. AT FOREST PARK, ST. LOUIS.

over as a rule before 8 a. m., and who shall say that this market has not been a success?

You may ask why these markets have not been established long ago.

It is because when a man is succeeding fairly well with his business by pursuing certain methods he is loth to make a change. The commission merchants have certain customers who regularly visit their establishments and to whom they sell the bulk of their stock. With the growers who peddle their stock from store to store it is much the same; they go over their route day by day and build up the trade upon which they depend. It has always been my thought that it is the fear of losing this established custom that has made the commission men and the growers so unwilling to take any part in a movement to open a market or to centralize the business in any way. I have turned the subject over and over and have discussed it with growers, commission men and dealers alike, and I cannot see but that all departments of the trade have everything to gain and nothing of value to lose. All the flowers in one place will bring all the customers to that centre, and this much-discussed regulation of prices will settle itself. Such a place will be the axle or center upon which all business will turn. The dealers whose trade demands the best flowers will be early on the ground to bid against one another, and so on down to the fakirs, who are always to be found and who may be called the scavengers of the market.

The 34th street ferry market in New York was started by the eagerness of the retail florists to get stock early in the morning. They couldn't wait for their grower to come with his flowers and perhaps find out at the last minute that he did not have what they wanted. They found it a better plan to meet him at the ferry when the boat came in, and then if his stock was low there were other growers from his neighborhood who could supply them. I have seen a large basket of flow-

ers brought into the restaurant where the market was held containing probably anywhere from \$50 to \$100 worth of flowers cleaned out almost before they could be properly accounted for. As good prices are obtained here as in the stores and commission houses down town for the same class of stock. Commission men who receive flowers by way of the ferry invariably offer them for sale there first. As much as \$10,000, or business to even more than this amount, has been transacted in a single day. This place, once a convenience, has grown to be a necessity, and is now firmly established in commodious quarters and is managed by a stock company, the members of which are all men interested in the business and success of the market.

One objection to this plan, advanced by some of the men who peddle their stock, is that if a market was started a number of the growers would not join the movement, but acting independently would sell their flowers as usual by carrying them around, and the dealers being supplied would not visit the establishment.

In order to make a radical change such as this would be to most communities it would be necessary to have the co-operation of a majority of the parties concerned. That is to say, growers controlling more than half of the flowers offered for sale would have to agree that their business should be transacted in the market, either by themselves or through commission men. This accomplished success would be assured, as the balance of the trade would soon follow. Now when the peddlers appeared they would be told that "Our buyer is at the market," and they would very soon have to fall in line.

Again, I am told that when a glut is on the fakirs will flood the streets and ruin the business of the storekeepers.

In New York at certain seasons of the year enormous quantities of flowers are daily offered for sale, very many more than can be handled by the present store system. In these periods of apparent over-production the fakir is welcomed

with open arms by the large commission houses, and tens of thousands of dollars' worth of flowers reach the public through these curbstone merchants that would never be sold in any other way. In spite of this opposition, however, the retail business of New York city is growing rapidly and the beautiful stores and handsome turnouts of the prominent florists give every evidence of prosperity.

In conclusion I believe that the fault lies not in over-production, but in an imperfect system of reaching the consumer. A great deal is said about extravagance of the people in buying flowers, but I believe that less money is spent for these products of ours that do so much to elevate the taste and bring joy to mankind than for any other luxury.

Let us all, therefore, co-operate, work together and bring our flowers before the people, the whole people, rich and poor alike, and the returns will be found most satisfactory to every department of the business.

Horticultural Exhibitions; How to Make Them Successful.

[Abstract of paper read by Wm. G. Bertermann, Indianapolis, before the St. Louis convention of the S. A. F.]

It would be well to divide this subject into three parts: trade exhibitions, exhibitions for artistic effect and exhibitions for profit.

Trade exhibitions are held simply for the purpose of enabling the wholesalers to display their specialties to the retailers. These exhibitions in connection with our annual conventions have grown in importance, and are also improving in the quality of exhibits and number of goods shown. While it is not absolutely necessary to have elaborate decorations at these trade exhibits they should have a finished and clean appearance, and that can only be had by a systematic arrangement of the space assigned for that purpose. Each separate exhibit, if finished up nicely in correspondence with the bal-

ance, will be more effective than goods set up with no apparent desire to please the eye. The trade exhibitions are generally open to the public free of charge, and the managers should see that the room or hall is inviting, and that all exhibits are given attention during the days of convention. I do not think it advisable to charge admission to these exhibitions.

Exhibitions for artistic effect: This is a subject of great importance. The exhibitions are generally given for the purpose of showing the public the advance of floriculture, and also how flowers can be used to the best advantage and with most artistic effect. In arranging for these exhibitions do not lose sight of this fact. We must have a committee on decoration and a committee on arrangement of displays. They must work together to give the whole exhibition an artistic and finished appearance. But can we give this appearance with cheap muslin flags, Chinese lanterns, or other cheap material, that can be seen every Fourth of July, or on other holidays? Certainly the plants, flowers and other displays must also be first class, but these can be viewed at leisure when in the hall proper. At the first glance the general effect must be striking and also greatly different from the last exhibition. This general effect (everything else being in keeping) will be worth many dollars in advertising the exhibition.

After giving the visitor this good impression let us see what we have to show him in detail. Here we have a display of well grown, large, blooming plants, chrysanthemum or other kinds; there a symmetrical bed of single stemmed chrysanthemum plants; here a fine group of tropical plants, there a specimen palm on a high pedestal, its sides hung over with vines. Now we come to a low table of well arranged cut flowers in bowls and vases, the table covered and hung on the sides with clean white muslin; between the bowls and vases ferns, smilax or asparagus, always kept in fresh condition. Then comes a table of large chrysanthemum blooms and a table of beautiful roses in suitable bowls or vases, intermingled with admantium plants. Then comes the orchid display, either arranged in a cave or in exquisite glassware, backed with a large mirror, or they could be arranged on a mossy green bank, anywhere so they can display their full beauty.

In one corner of the hall the flower booth should be located, nicely arranged and decorated. The best flowers that are in the market should be on sale, and of course by all means have a few good looking young ladies to sell the same. These should be competent. Generally daughters of members attending the exhibitions take a pride in helping to make the flower booth a success. I find that a great many plants can also be sold in the flower booths during the exhibition, especially where there is an attendance from a distance.

Arrangements must be made to reserve a part of the floor space for chairs and settees; a corner here, a small space there, for a few chairs in under some palm, or in a doorway not used, are excellent places to take a rest. Now the music must come in for a share of attention; take the best you can get, it will be appreciated. Sometimes some special feature in the musical program will more than repay the cost of it in increased attendance. I find you can not get too many special features in your exhibition, taking for granted that they are suitable.

The decoration of the stage is generally a hard job, especially when funds are limited; still it must be done and helps the general effect. If the ceiling of the hall is high and suitable for a center piece something should be thought of in time, a large bell, a canopy, etc. From this you can arrange your laurel wreathing hung with Florida moss, large balls of palm leaves, or pampas grass. Some say all this is not needed. I am always afraid to leave out the finishing touches to an exhibition. The entrance to the hall should require the decorator's attention without fail, it is an advertisement in itself. Whatever there is about floral exhibitions must be considered as coming from the florists' trade, and the public judges accordingly.

Exhibitions for profit: The first question is, must we make money out of our annual exhibitions? No, I think not, but enough should be taken in at the doors to cover all expenses. Speaking for myself, I have always been in favor of making an exhibition an artistic effect, no matter how the result would be in a financial way. The show or exhibition must be a success in regard to excellence. I think if that can be done it pays the profession, while it does not at the end leave a surplus in the treasury. It will, however, prove a financial success if not abandoned too soon. I remember well when our society held their first exhibition seven years ago. We had great expectations. Everything was arranged to have a great exhibition, and the committee and a good many members expected to see the people crowd into the hall the opening night, but what was our surprise when barely enough came to make a sprinkling between the beds of plants and tables. The following days and evenings the attendance increased, but not near what was expected, and this in spite of the glorious description given in the daily papers of our undertaking. But considering that everything has a small beginning we consoled ourselves that the next exhibition should show a better result. We have kept on, our receipts increased, but our expense also increased. We found that it was necessary to do more elaborate advertising, especially as we intended drawing on country attendance. We now have arrived at the point that the public expects and awaits with pleasure our annual exhibitions; to some extent it is the social event of the season among the well-to-do. I don't mean to say that our attendance consists only of the rich, but these are the visitors that must set the example.

Right here I would advise all managers of exhibitions to make the admission not less than fifty cents, in the evening especially when you have good music, which sometimes is alone worth the price of admission. The point is well taken that twenty-five cents would be cheaper for a certain class of people, but our experience is that the majority of visitors are well-to-do. They are willing to pay for a show that is worth seeing, and we must educate them to the point that a beautiful show can not be prepared at great expense and seen for twenty-five cents. You will keep this class of visitors away with a cheap admission, but if you wish to draw the general public for the evenings one night could be set apart for twenty-five cents. During the day I would advise at all times a twenty-five cent admission, because if you have attendance from outside of the city they figure on the expenses coming on the railroad, then you have a great many who bring their children to see the show.

Children under twelve I advise admitting free at all times.

Advertising needs careful attention. The principal newspapers should be given a good sized advertisement, others a few lines. Of course the reporters and editors must be taken care of, and it is the committee's fault if the reports are all of a heap, mis-spelled and mis-named. Advertising by issuing a souvenir has been found by some committees an excellent idea. A good supply of neat window cards, some money spent with the bill poster, slips for merchants and members to put in their letters, and many other ways may be found for bringing the affair before the public. Special premiums are a great help if given willingly. More general displays and less competitive displays is my plan for future floral festivals. A great deal might yet be said about the judge system, the display of designs, etc., but these are all items for the exhibition proper, and while they help to make the show a success they are out of the reach of my paper.

How 'Can We Best Increase the Love of Flowers Among the People.

BY GEO. C. WATSON, PHILADELPHIA.

[Read before the Society of American Florists at the St. Louis Convention.]

[CONCLUDED FROM LAST ISSUE.]

The superintendent of public schools might be called upon by a competent committee and means and ways devised whereby the study of gardening and botany might be greatly facilitated. Donations of young plants might be given to the scholars to grow and exhibit. Specimens of flowers might be sent to the schools to assist the teachers with their botany classes in winter. The scholars might all be given a free view of every flower show, or if that were impracticable, those showing a certain proficiency in learning their lessons might be given a ticket to the flower shows as a prize. A great deal can be done through the public schools if it is only gone about systematically. If it is necessary to raise money to accomplish this, the money can easily be raised. The average man or woman would much rather give a dollar for such an object than to buy petticoats and preaching for the Hottentots.

Get the newspapers interested. Establish a letter-writing corps in your town or village. Divide the work among the members of this corps, giving each one a subject to write up for a specified date. If there are twelve members in the corps this would only require one letter from each member in three months; but your local paper or papers would be supplied with a weekly letter on gardening and the individual effort would be very slight. The newspaper or newspapers should be approached in the beginning, the object to be attained explained to them, and how the same could be accomplished with their help. They would be only too glad to acquiesce, because a weekly letter like that suggested would be a valuable and attractive feature in any newspaper.

Encourage any member of your horticultural society and every one who is at all interested in flowers or plants to subscribe for at least one paper devoted exclusively to horticulture. There are several good papers of this description; the following may be specially mentioned, *Gardening*, published in Chicago, a dollar a year; *American Gardening*, published in New York, a dollar a year; *Garden and Forest*, published in New York, four dollars a year. Suggest to a beginner anx-

ious to learn that a good practical book on gardening is one of the first things he has to get and study up. The weekly, bi-weekly, or monthly gardening paper will be the more appreciated once the fundamental or rudimentary rules of gardening are thoroughly mastered. Recommend some book specially written for this climate, such as *Practical Floriculture*, by Peter Henderson; or the *Garden's Story*, by G. H. Ellwanger. If their purses warrant every gardener or would-be gardener should also possess a copy of Nicholson's *Dictionary of Gardening* if he would be thoroughly posted and up to date.

So far, our consideration has been mainly directed to the agencies with which we are all concerned; but there are other agencies that only a limited number of us are connected with. Among these latter the most important is the work of the catalogue men. Any essay, however limited or superficial, would be greatly lacking, if it did not recognize the grand work which the modern catalogue is doing in spreading a love of flowers among the people. The catalogues go everywhere all over the country—to the log cabin on the prairie and the miner's camp on the mountain, as well as to the home of the farmer and suburban resident near the centers of population. The catalogue is the real pioneer in spreading a love for flowers. Away in the backwoods, where literature is represented mainly in tree-leaves and blades of grass, the catalogue is welcomed as eagerly as the first snow-drop of spring, its wonders are a source of endless delight to young and old, its big cabbages and enormous potatoes, its overgrown tomatoes and ponderous pumpkins, are more effective in tickling the risible sensibilities of the farmer and his family than all the witticisms of all our Eastern funny papers rolled together. And what harm if they do laugh a little and take the jocular seedsman in his own vein! Far be it from us to encourage misrepresentation, renaming, and kindred evils which we all deplore. But did any one ever consider this phase of the subject, that to catch the attention of your prospective rural customer it is necessary to use a little vigorous metaphor at times. If a seedsman claims that his "Jumbo Pumpkin" is almost as big as Jumbo, your backwoodsman is amused and skeptical; but he buys some seed of this "Jumbo" all the same *just for fun*. Now, so long as they make a commencement in gardening and begin to beautify their homes, what does it matter if it was *just for fun* they began, and who will dare to breathe a syllable against the catalogue that induced them. Let us bless the catalogue and the catalogue men, exaggerations and all, and if we must admonish those Munchausens amongst them once in a while, let it be gently done, for horticulture owes them a debt of gratitude that she can never repay.

There is one way that the S. A. F. could help the catalogue men, and that is by starting a movement to have flower and plant catalogues carried at newspaper rates. Considering the noble work the catalogues do in spreading a love of flowers among the people they have the strongest claim on the consideration of the post office department, and a competent committee should be appointed by the S. A. F. to accomplish a reduction in postage if possible. Many seedsman have already managed this by calling their catalogues "flower magazines," and the ex-postmaster general actually had a book catalogue and price list called

"Book News" carried through the mails at newspaper rates. But what we want is to treat all alike—put all on the ground floor and carry all their printed matter at the same rate, no matter what they may call it, a catalogue, a magazine or a newspaper. The S. A. F. secured, by well directed efforts, a reduction in the rates of postage on seeds and plants, and there is no reason why they should not be equally successful with this other reform.

In conclusion just one word for the good work that is being done by our periodical literature in spreading a love for flowers. When such magazines as the *Ladies' Home Journal*, with its 750,000 circulation every month devotes a large space regularly to this subject, employing the best artists and such able writers as George H. Ellwanger, F. Schuyler Mathews, H. H. Battles and other experts, it will be readily admitted that the influence for good is enormous. The *Ladies' World*, the *Delineator*, *Demorest's*, with their enormous circulations also follow on the same lines, and there are hundreds of other papers with smaller circulations that are also doing splendid work. The only regret in regard to the latter is that they are not always thoroughly reliable. For instance that awful calla story will be printed by them every time it comes along, no matter how often it may be exposed and laughed down. There is only one way to secure improvement in this respect, and that is for these papers who can't afford a horticultural editor to get a weekly syndicate letter from some competent writer and use that instead of the hap-hazard matter they now print. Perhaps there is a field here for a national letter writing corps similar to that suggested for local societies?

These few suggestions are but random thoughts from a host that come crowding for recognition when one begins to think this matter over, and it is almost impossible to do such a big subject any kind of justice within the limits of a short essay. Remembering, however, that this is summer weather, that St. Louis is far from the cooling breezes of Atlantic City; and that the "quality of mercy should not be strained", feelings of compassion for the sweltering condition of the members demand that this matter be cut as decollete as possible. The foregoing may therefore be briefly summed up as follows:

SYNOPSIS.

- I. Give cordial support to the S. A. F. and its affiliated local organizations and the trade papers.
- II. Give active assistance to all horticultural societies especially to that in your own locality.
- III. Train the young. Encourage plant growing among scholars at public and Sunday schools, botany classes and similar efforts. Above all make the grounds of your school house beautiful.
- IV. Interest the newspapers, and keep them supplied with reliable matter by establishing a letter-writing corps in each locality.
- V. Recommend every member of a horticultural society to subscribe to at least one gardening paper, and if a beginner in gardening also see that he studies up a reliable treatise on the subject of gardening.
- VI. The modern seed and plant catalogue being the most effective pioneer in spreading a love of flowers, especially in isolated localities, it should be encouraged as much as possible, and a movement to reduce postage on same to newspaper rates cordially supported.

VII. Let measures be taken to form a syndicate of horticultural writers to supply the periodical literature of the day with reliable matter, to take the place of the hackneyed and unreliable and uninteresting stuff that is now largely in use. This syndicate would be self-supporting, as their matter would have money value.

If these and the many other suggestions that will doubtless be brought out from the members during the discussion of this subject be actively and conscientiously worked out by each and all of us as far as lies in our power we will have the pleasure of witnessing a great increase of a love of flowers among the people. This love of flowers is growing now, and we want to see it keep on growing until this country becomes a fairy-land of beauty, dotted with beautiful gardens all over its wide expanse. When Columbus first came over here in 1492 he found a beautiful country. Here is what he wrote in his journal.

"The Beauty of the new land far surpasses the *Campana de Cordova*. The trees are bright with an ever verdant foliage and are always laden with fruit. The plants on the ground are high and flowering. The air is warm as that of April in Castile, and the nightingale sings more melodiously than words can describe. At night the songs of other smaller birds resound sweetly and I have also heard our grasshoppers and frogs. Once I came to a deeply enclosed harbor, and saw a high mountain that had never been seen by mortal eye, and from whence gentle waters flowed down. The mountain was covered with firs and variously formed trees with beautiful blossoms. On sailing up the stream which empties itself into the bay, I was astonished at the cool shade, the clear crystal like water, and the number of the singing birds. I felt as if I never could leave so charming a spot; as if a thousand tongues would fail to describe all these things, and as if my hand were spell-bound and refused to write." (*Journal of Columbus on his first voyage (1492) from A. Von Humboldt's "Cosmos."*)

A delightful picture truly and showing that the old discoverer fully appreciated the beauties of the new country. Indeed we have to admit that he did so in a greater degree than do a large percentage of its present denizens. We are so busy looking after the almighty dollar, and bragging about the bigness of our country that we have neglected to do much in the way of making our country even more beautiful than it is. But we are coming to that too and bye and bye we will not only have the biggest but also the most beautiful the world has ever known—a fairy-land of flowers, a paradise on earth.

How Can We Best Increase the Love of Flowers Among the People of This Continent.

BY ROBERT CRAIG, PHILADELPHIA.

[Read before the St. Louis Convention of the Society of American Florists.]

That is to say, how can this society work to the best advantage in this direction? There is no doubt that the love of flowers and ornamental plants, and interest in their cultivation, is more general in America now than at any previous time. This is evidenced by their increased use in public parks, cemeteries, at railroad stations, and in private gardens and grounds. Every member of this Society can do something to help on the good work. Flowers and plants need only to be shown to the people in attractive arrangement and under good cultivation to make their own way to the hearts of every one, and a florist cannot do better than to begin at his own home to show a little good floriculture. Most of us have not fully improved our opportunities in this respect; we cannot do too much in making our own home surroundings attractive with flowers and thus give our patrons ideas of what may be done.

The various florists' clubs throughout the country should improve every opportunity for cultivating public taste. Let me throw out a few practical suggestions. Why would it not be a good idea for each florists' club to select a hotel or theatre or other public place and keep it decorated (at a nominal cost to the proprietors) for the purpose of cultivating public taste? The work could be so divided up among the members as to be but a light tax on each, or a part of their fund could be devoted to this object. This would certainly be productive of good results. Papers should be read at the club meetings giving amateurs an idea what to grow in their gardens, with detailed cultural information, suggestions as to arrangement, etc., and also information as to plants best suited for house culture and their proper treatment under such conditions. All such matter the daily papers and weekly and monthly magazines would gladly publish. Most of the disappointments of amateurs in attempting to grow plants arise from ignorance; and they would be very grateful for such help as the florist club could easily them.

These organizations should also take more interest in the floricultural embellishment of the public parks. In some cities, notably Chicago, a special tax is levied for the purpose of keeping up the parks, and a liberal portion of this special fund is set apart for flowers, and I am informed by many citizens that no part of the public tax is more cheerfully paid. The people enjoy the flowers, and many of them fall in love with them and are tempted to grow them around their own homes. The parks are great educators, and the florists' clubs everywhere should use concerted efforts to have a portion of the public funds devoted directly to the cultivation of flowering and ornamental foliage plants in public grounds; in no way could they do more good.

Public exhibitions should receive the cordial support of every club and every individual; it should be considered as a duty for each to make some personal sacrifice for the general good; there is nothing new in this idea, but it cannot be too often advanced. As an evidence of what concerted effort and a little enthusiasm may accomplish permit me to remind you of the exhibition of carnation blooms held in Pittsburg last February by the young branch of this organization, the Carnation Society. I have seen many large exhibitions, but I am free to say I never attended any one so perfectly delightful. What marvelous flowers! There was never before brought together such an exemplification of the possibilities of the "Divine Flower," and the only weakness in the management of the exhibition was that it was not fully advertised. Special and truthful reports of all exhibitions should be prepared for the press; it is gratifying that all good information of this kind is cheerfully published; this is one of the hopeful signs of the times. About two thousand of the Pittsburg people saw this show; it was capable of delighting the whole population. It was a demonstration that Mr. F. Dorner and other American raisers of seedlings have carried the development of the perpetual carnation further than any of their competitors.

What has been done by that young organization should stimulate the Chrysanthemum Society and the Rose Society, and should hurry on the advent of the Orchid Society and other potential subdivisions of the S. A. F. I might advance other ideas, but think we should not at present attempt more than we can con-

veniently do; it is not difficult to act upon the one or two suggestions thrown out, and if this is done these few remarks are not made in vain.

The Dark Side.

Among the visitors from Boston to the St. Louis convention was Mr. Alex. Montgomery, the well known manager of Waban Rose Conservatories, who, with his brother John and his son Alexander, accompanied the Boston party and attended the meetings of the first two days. They left St. Louis for Chicago on Thursday evening. On Friday morning a telegram was received at St. Louis conveying the sad intelligence that their mother had been terribly burned by an oil stove and that it was doubtful if she could survive. Friday and Saturday were spent in a frantic endeavor by Mr. Montgomery's friends to locate him, but the World's Fair is a large place, and notwithstanding all the efforts put forth the search was fruitless, and it was not until Sunday afternoon, when Secretary Stewart chanced to meet them unexpectedly in the fair grounds, that Mr. Montgomery and his party learned the sad tidings, and immediately started for home. In the meantime the news had been received by others, but without Mr. Stewart's knowledge, that the lady had died on Saturday morning. This sad event cast a shadow over the pleasures of all, and many and heartfelt were the expressions of sympathy and sorrow.

Mr. and Mrs. John Burton of Philadelphia were also called home suddenly by a telegram announcing that Mrs. Burton's mother was seriously ill.

The Trade Exhibit at St. Louis.

E. H. Hunt, Chicago, Florists' Supplies, Bulbs, Seeds and Garden Implements.

W. J. Hesser, Plattsmouth, Neb., Palms and Decorative Plants.

Thompson, Anderson & Kennedy, St. Louis, Model of Greenhouse, 20 foot span.

Chadborn Kennedy Manufacturing Co. Fishkill, N. Y., Automatic Ventilator.

Lockland Lumber Co., Lockland, O., Greenhouse Building Material.

W. H. Elliott, Brighton, Mass., Asparagus.

Quaker City Machine Works, Richmond, Ind., Challenge Ventilating Apparatus.

J. D. Carmody, Evansville, Ind., New Departure Ventilator.

H. A. Dreer, Philadelphia, Palms, Ferns, and Decorative Plants.

Edwards & Docker, Philadelphia, Waterproof Cut Flower Boxes.

E. Hippard, Youngstown, O., Ventilating Apparatus.

C. H. Joosten, New York, Fostite, Magazine Bellows and Bulbs.

W. K. Harris, Philadelphia, Ficus elastica.

J. J. Polexfen, Baltimore, Fumigating Insecticide.

Detroit Flower Pot Manufacturing Co. Flower Pots.

Michel Plant and Bulb Co., St. Louis, Bulbs, etc.

Whilldin Pottery Co., Philadelphia, Flower Pots and Fern Pans.

John Gardiner & Co., Philadelphia, Bulbs and Mushroom Spawn.

Peter Herb, Mt. Healthy, O., New Carnation "Adalaida Kreskin."

Marschuetz & Co., Philadelphia, Baskets, Metal Goods and Supplies.

A. B. Hews & Co., Cambridge, Mass., Flower Pots.

E. Kaufmann & Co., Philadelphia, Florists' Supplies, Baskets and Metal Goods.

F. E. McAllister, New York, Seeds and Supplies.

F. R. Pierson Co., Fishkill, N. Y., French Cannas.

Pitcher & Manda, Short Hills, N. J., Decorative Plants.

A. Wiegand, Indianapolis, Palms and Pandanus.

H. Bayersdorfer & Co., Philadelphia, Supplies, Baskets and Wheat Sheaves.

C. A. Kuehn, St. Louis, Wire Clamp Florists' Designs.

Boston Letter Co., Florists' Letters, etc.

J. C. Meyer & Co., Boston, Silkaline.

D. B. Long, Buffalo, Photographs.

J. C. Vaughan, Chicago, Bulbs and Plants.

The following awards were made by the judges:

H. A. Dreer, for collection of decorative plants, a certificate of merit.

Chas. D. Ball, for collection of decorative plants, honorable mention.

Pitcher & Manda, for collection of decorative plants, honorable mention.

W. J. Hesser, W. K. Harris, A. Wiegand and J. G. Heintz for exhibits of plants, highly commended.

Pitcher & Manda for collection of bulbs, a certificate of merit.

John Gardiner & Co. for collection of bulbs, honorable mention.

H. A. Dreer, for collection of bulbs, highly commended.

Peter Herb for new carnation "Adalaida Kreskin," a certificate of merit.

F. R. Pierson Co. for canna blooms, honorable mention.

Michel Plant and Bulb Co. for the "Albino" tuberose, honorable mention.

H. Bayersdorfer & Co. for display of florists' supplies, a certificate of merit.

E. Kaufmann & Co. for display of florists' supplies, honorable mention.

F. E. McAllister for display of florists' supplies, honorable mention.

Marschuetz & Co. for display of florists' supplies, honorable mention.

E. H. Hunt for collection of florists' supplies, honorable mention.

N. F. McCarthy & Co. for fancy pottery, highly commended.

C. A. Kuehn for wire designs, honorable mention.

E. Hippard for "Standard" ventilator, a certificate of merit.

Quaker City Machine Co. for "Challenge" ventilator, honorable mention.

Detroit Pottery Co. for flower pots, honorable mention.

Whilldin Pottery Co. for flower pots, highly commended.

Lockland Lumber Co. for cypress building material, certificate of merit.

Thompson, Adams & Kennedy for section of modern rose house, a certificate of merit.

Edwards & Docker for waterproof cut flower boxes, a certificate of merit.

The Bowling Contest.

This was, as usual, a decided attraction at the convention and on Saturday morning every foot of seating space along the alleys of the Pastime Athletic Club was filled. Four teams entered, namely, New York, Philadelphia, St. Louis and Chicago. Some excellent scores were made and applause from the spectators was frequent and prolonged. New York won both the St. Louis and Spaulding cups, while the individual prize for highest score went to Mr. W. K. Harris of the Philadelphia team, who made a score of 240. Refreshments were served ad libitum by the St. Louis boys, who omitted nothing that could add to the com-

fort and enjoyment of their guests. An engraving of the cup offered by the St. Louis club and won by the New Yorkers is given in this issue.

Following is the score in detail:

NEW YORK.

	1st game.	2d game.	3d game.
P. O'Mara.....	159	195	149
W. Dihm.....	161	197	203

G. L. Grant.....	179	161	138
A. McAdams.....	133	149	103
W. Kreitling.....	130	76	103
J. Wilson.....	132	142	161
H. Balsley.....	147	126	137
	827	814	771—2412

At the conclusion of the contest by the teams the captains played three games, with the result in favor of New York. Following is the score:

CAPTAINS' GAMES.

	1st game.	2d.	3d.	Total
New York (O'Mara)	152	221	192	565
Phila. (Anderson)....	194	154	191	539
Chicago (Hausw'th)	158	213	134	505
St. Louis (Benecke).	143	136	157	436

The prizes were then presented, and led by Mr. O'Mara, all joined in giving three rousing cheers for the St. Louis boys and the Pastime Athletic Club.

The World's Fair.

The caladiums are still in fine order, and are well arranged under the dome and in the south curtain. A quantity of new varieties, just received from Brazil, were potted about two weeks ago, and will be in good condition in a month or six weeks time. It is expected that they will make an interesting display, as they were all sent as novelties. The plants under the dome have done very well, continuing in good condition.

The lily of the valley is now displayed under the dome. There is not a great variety of flowering plants at this season, and they are a great addition. Among the orchids now in bloom is *Vanda cœrulea*, some *arides*, *cypripediums*, *mormodes*, etc. A very fine *crinum* is in bloom in the south curtain; it is an old plant belonging to Mr. Jno. Goode, and has a tall inflorescence of huge fragrant flowers, soft pink, outside shading to crimson. Supposed to be *C. Zeylanicum*.

The Lemoine gladioli are still in good bloom north of the Horticultural Building, and there are also some very good sorts shown by E. Forgeot, of Paris. But Lemoine's hybrids are the chief glory;

among them is *Pactole*, a deep golden yellow, and *Etoile d'or*, paler yellow, but really two of the best gladioli of that color one could wish. The crimsons, pinks and scarlets show some excellent effects, and there are some rich heliotrope purples that are a decided step in the direction of blue. A gladiolus of genuine blue does not seem such a faraway possibility. There is an exhibit of cut gladiolus blooms under the dome from C. H. Allen, Floral Park, N. Y., which is agreeably arranged in connection with the lily of the valley.

The canna beds are doing famously, flowering freely for the most part, and attracting much admiration. It may be

noticed, however, that some of the yellows that are something between salmon and apricot appear more inclined to burn in the sun than the clear yellows or reds. Where a bed is planted with one variety only in a mass the effect is better than when the varieties are mixed.

The aquatics are growing nicely, though flowering but little yet. In the New York greenhouses the roses are in good bloom; Mrs. W. C. Whitney is flowering very freely. The tuberous begonias are so far improved that they can now permit the flowers to remain. Out of doors the tuberous begonias advance but little; it seems to be a trying locality for them.

THE ST. LOUIS CUP WON BY THE NEW YORK BOWLING CLUB AT THE ST. LOUIS CONVENTION

In the department greenhouses there is plenty of stuff just coming on; the chrysanthemums are doing very well. A good many are planted in boxes, so as to make a large mass of bloom. All the usual summer propagating operations are being carried on, so that any unexpected call for material may be filled.

Outside this is rather an awkward time; the summer stuff is beginning to suffer, and autumn flowers are not yet ready to take its place. It is so extremely dry, too, and there is a scarcity of water as well as help.

Among the sunflowers now showing one of the most attractive is *H. argyrophyllus*, a large annual sort. The leaves are a silvery green, the ray florets sulphur yellow, with dark brown disk. It is large in both growth and flower, and makes a very handsome showing. The sunflowers in variety will be very showy from now on. The Island is suffering very severely from the prolonged drouth; trees and shrubs, as well as flowering plants, are burning badly. Two days of soaking rain would be of incalculable advantage to the autumn flowers.

The Horticultural Congress.

The Horticultural Congress of the World's Columbian Exposition at Chicago convened in the Memorial Art Palace on Michigan avenue on Wednesday morning, Aug. 16, as per published program. There was a large attendance and much interest was manifested.

President Bonney of the World's Congress Auxiliary welcomed the visitors in the following words:

"Friends of the seed, the flower, the fruit; fair trinity of potency and beauty and use: The fairest conception of human existence is of life in a garden, with its exquisite beauty and peace, and from which culture and care have banished every hurtful thing. Among the pictures in the temple of my own memory there is none brighter than that of the garden near the family mansion, in which my mother gathered roses and violets and the early fruits.

"The loveliest symbols of thought and aspiration of sentiment and affection are flowers. There is no more deep and subtle mystery than that which conceals plant and shrub and tree in the seemingly simple structure of a seed.

"There is no more charming art and occupation than the cultivation of flowers and fruit bearing trees. There is no calling more innocent and conducive to human welfare than that of the horticulturist. The improvement and beautifying of public parks and grounds depends chiefly upon the gardener's art. The protection of fruit crops, involving vast pecuniary interests, and the best part of the food supply of great numbers of people is almost wholly dependent upon the studies, the experiments and practical wisdom of those whom this congress on horticulture represents.

"The trade and commerce in seeds, fruits, flowers and nursery products is of such magnitude and importance that it is justly regarded as one of the greatest business interests of the world. It is therefore most appropriate that arrangements have been made for a congress on horticulture among the many congresses of 1893.

"This congress has been organized by a committee of organization, of which Mr. J. C. Vaughan is chairman, assisted by a committee of co-operation of the American Seed Trade Association, of which Mr. W. Atlee Burpee is chairman,

and a committee of co-operation of the Society of American Florists, of which Mr. E. G. Hill is chairman. Upon the nomination of these committees Mr. P. J. Berckmans has been appointed the presiding officer of the opening session of this congress.

"A glance at the program prepared shows that it is properly representative of the various interests involved. France, Germany, Denmark and many American states are represented by appropriate subjects and contributors. Other states and countries will doubtless take part in the discussion. In behalf of the World's Congress Auxiliary of the World's Columbian Exposition I welcome you to this Congress."

He then introduced Chairman J. C. Vaughan, who added further brief words of welcome, and who introduced Mr. P. J. Berckmans as the presiding officer for the general session.

Mr. Berckmans made an eloquent opening address and then took the chair.

The paper on "Technical Horticultural Education" by Prof. Wm. Trelease of the Missouri Botanical Garden was then read by that gentleman. It was an able and comprehensive essay and was discussed in a most interesting manner by Prof. Dr. L. Wittmack, who explained the systems in use in Germany, and Mr. Henri L. de Vilmorin, who described the workings of the French horticultural schools. Prof. L. H. Bailey followed and pointed out the need of different methods for America from those employed in European countries on account of the wide difference in conditions.

The essay upon "Improvement and care of public grounds; developing and conserving natural beauty," by William McMillan, superintendent of the parks of Buffalo, was an able paper and was most effectively delivered by the essayist. It was discussed by Mr. Rob't Craig.

Other essays delivered were on the "Relation of experiment stations to commercial horticulture," by Charles W. Garfield of Michigan, and on "Horticultural displays at future World's Fairs," by Prof. Dr. L. Wittmack of Germany, both of which were exceedingly valuable and bore evidence of much thought and care in their preparation.

Taken altogether the essays presented at the congress are of the very highest order and the printed report will be a most valuable document.

On Thursday morning Mr. Henri L. de Vilmorin of Paris read his essay on "Pedigree or grade races in horticulture" before the seedsmen's session. It is given in full in the seed trade department of this issue.

On Thursday evening at the florists' session Mr. Craig read his essay on "The past and present of floriculture" and Mr. Hill read his paper on "The future of floriculture." The latter is given in full below. Prof. Goodale failed to prepare the essay assigned to him on the past of floriculture, so Mr. Craig combined the past and present in his paper.

The Future of Floriculture.

BY E. G. HILL.

[Read before the Florists' session of the Horticultural Congress, Chicago.]

We have listened with deep interest to the eminent gentleman from Philadelphia on the past and present of floriculture: retrospection shows us the day of small beginnings, the troubles and difficulties that were overcome and the gradual growth of the art with the growth of the country; in the present we look back at the "Hill of Difficulty" which

we have all climbed and delight to recount the triumphs of floriculture.

We have the past and the present as a gauge with which to measure the future of this our chosen profession.

We must remember that only a few decades ago the greater portion of country comprising the states of the Federal Union, as well as the British possessions north of us, was one vast wilderness; the pioneers of civilization on our western continent overcame difficulties mountain high, subdued the forest, bridged rivers, built cities; life was a struggle for existence made up of hardship, deprivation, suffering and toil. A better day has dawned, and with the increase in wealth and the growth in education a marvelous transition is taking place. If in the past things esthetic found no place they were simply crowded out by sheer physical necessity.

The word floriculture strictly defined, means the culture of flowers, but each day gives to it a wider significance; it means not only the growing of plants and the production of flowers, but it also implies the artistic arrangement of both either in the embellishment of grounds or the decoration of interiors; it implies a knowledge of the laws which govern plant life; an understanding of the soils from which they derive their sustenance; an acquaintance with their enemies and how to conquer them.

Before attempting to cast the horoscope of the future, let us ask what are our claims to greater growth and a higher development in floricultural art.

The cultivation of plants and the production of flowers have an elevating influence upon those engaged in the work, and also upon the communities where the work is carried on, and insensibly helps to a better code of ethics. Wonderful lessons are learned by a study of plant life, if only it is studied seriously; the artist is taught *form, arrangement and color*; pendent branches, trailing vines, glossy foliage, are suggestions of value to the decorator.

Flowers are daily becoming more indispensable in all the tender offices of friendship, hospitality and the home life. They grace the table of rich and poor, doing even more than the spotless linen or shining ware to make the meal something more than the mere satisfying of the appetite. When our friends meet good fortune, we send our congratulations in a bouquet of roses. When sorrow has crossed their path they read with dimmed eyes our sympathy in dewy flowers. We strew the bridal path with roses and lilies symbolic of our wishes for the bride, and the loved ones laid away to rest are covered with a pall of fragrant bloom. Flowers seldom blossom so sweetly and appropriately as in the sick room, bringing a message from the outer world to the one shut in, how often awakening in the convalescent his first interest in the old life which had so nearly slipped away from him.

Floriculture has a great future in America from the fact that the home is the center and citadel of our American civilization. The homes of the future will conserve and support our art. Until recent years the average American town has had very little architecture worth the name; but every season beautiful houses are taking the place of the ugly structures which were the outgrowth of the haste and straitened circumstances of their builders: these new and tasteful homes are embellished with tree and shrub and vine and plant, and as time adds to the beautiful effect produced, their educational in-

fluence will be felt by our people, who are not slow to learn the lesson of beauty when properly spread before them, and we venture to predict that both the cottage and the mansion of the next generation will furnish models of beauty as much by the correct use of floral decoration as by the increased beauty of the architecture.

The past ten years have seen our profession take a vast and rapid stride; the pessimists are not few who have predicted an equally sudden collapse, but we are positive that it was but a phase of rapid growth, which will become slower and steadier, but will lead us forward for generations to come. One of the greatest educational influences of the times is the work done by the horticultural press in so attractively leading their readers on to a higher standard of home adornment. In addition to the plants now in general use, we shall see from year to year an increasing demand for the more purely decorative plants, such as palms, dracenas, pandanus and crotons for interiors, while the newer trees and shrubs will attract increasing interest.

The time will come when the railway stations shall be beautiful from one end of the land to the other, furnishing object lessons for the million; the value of which can not be estimated: already some beautiful samples are shown on the leading lines. Cemetery superintendents are falling into line and the great city burial places have been transformed into Edens of beauty, furnishing models which nearly all the smaller towns are copying; contrast the old country burying ground with the modern cemetery and see what landscape art and floriculture have done, and this work is only in its infancy, with a wide outlook for the future.

Public parks and gardens are no longer regarded as luxuries and show places for great cities only, but are deemed absolute necessities for crowded populations, while every town governed by a council with any forethought or concern for the welfare of its future inhabitants, early in its history looks about for a choice bit of natural scenery and plenty of pure, cool spring water as a nucleus about which a few years later, the landscape gardener and the florist, at the bidding of the people shall create a bower of beauty of tree and vine and flowering plant.

There ought to be no better examples of neatness and of floricultural embellishment than in the florists' establishments of our country, both wholesale and retail. The successful florist of the future must be an artist as well as a mere grower of plants; our profession is both an art and a science. Being able to grow plants well is, of course, fundamental in all stages of our history, but in coming years, there must be added to this artistic insight into the fitness of things, which will guide the florist in his combination of colors, which will prevent his arrangements from becoming grotesque in their stiff formality, which will banish the hideous floral "combination design," and show in its place forms of simplicity and beauty only; which will make his boxes of cut bloom when ready for delivering "a perfect gem in a perfect setting."

The artistic florist will make his place a model which the average customer may safely copy, not as now so often seen an aggregation of glass houses, workshops, dirt piles, disorder and anything but a place of floral beauty. Of course with the majority of us, the greenhouse is a manufactory, where coal and water and steam and soil are used in converting raw material into forms of beauty, but a careful forethought and some common sense

planning by a man who is really educated up to the love of the orderly and the beautiful, will find a way to keep the dust and grime and litter in subjection, and present to his visiting customers only the refined product in its most beautiful arrangement. Where we have now only a few establishments such as found at Short Hills, Floral Park, Mount Hope Nurseries, West Chester, Pa., and other places in the country, twenty-five years hence similar examples will be found dotted over every section of our union.

The scientific florist of the future will have undergone a technical training in an institution where the knowledge of the many gained by personal experience is at his hand classified and ready for use, needing only to be verified as he goes about his work from day to day; he will not go groping in the dark as to the proper constituents of certain soils for given plants nor for the proper remedies for certain diseases, nor for most destructive agencies with which to combat injurious insects.

What floriculture will be in the future depends largely upon the classified knowledge at the ready command of the future florists, and his art in using it, and also upon his artistic training and the education of the heart. Technical schools will do for floriculture what the industrial schools are doing for workers in metals, fabrics and woods. Such institutions already have a footing in Europe, and their influence is being felt through the young men of the profession. We in this country shall hail with delight every effort looking towards the founding of such schools. The men who elevate their profession are invariably students, whether in or out of school, men who by research and study solve problems and make rough paths straight. The engineer plans the outline of tremendous undertakings in the quiet of his study, working out by compass and rule its parts and construction, and later on his bridge spans the Mississippi; as our friend Mr. Whittle of Albany has suggested there is no reason why theory and practice need be divorced in floriculture. I can do no better than quote his admirable words at our fourth convention: "When will the world know horticulture to be what it is? A pursuit that requires of its workers constant forethought and continual study. When gardeners themselves are willing to lift the class by the grand power of education from the rank of mere artisans. When by the careful and laborious investigation of the secrets of nature we can advance theories and cite facts—not till then shall we have our place in the world of thought."

It is estimated that the twentieth century will see over a hundred millions of people north of the Rio Grande; grant three-tenths of them a love for flowers, and do you see what the floriculture of the future must become. The future shall bring forth the wondrous product of the hybridizer; new varieties of plants suited to our climate and requirements shall be produced. Great possibilities are in store for us in this direction; America will in the near future produce its Lemoine, Guillot and Veitch, let no pessimist discourage, but with quickened step let us march hopefully forward to that larger and brighter future which awaits American floriculture.

Miscellaneous Seasonable Hints.

About the 20th of this month is the best time to sow pansy seed for spring sales. If sown much earlier they get leggy by spring, and if later by a few

weeks they are rather small to pass through the winter. A frame with the sash raised back and front and a heavy shade on is the best place to sow them. It takes longer to sow in drills, but it pays; you can cover them better, and you will get far more plants to the ounce. I use a rod one inch square and when the distance between rows is marked or guessed about two inches press one angle of the rod half an inch into the finely prepared soil. That is a sufficient drill, and cover just enough to hide the seeds. When well up remove the sash and keep them well watered if it is a dry time. I have seen red spider attack a bed of seedling pansies and nearly ruin them before they were discovered. A good syringing every evening is all you can do to prevent this. It pays to take time and care with your pansy beds, for the seed of a good strain is very expensive and it doesn't pay to grow any other. Those who grow many thousands can hardly afford to cover them all winter with glass; they usually plant them in the field and at the approach of hard frost cover them with straw, or what is excellent, hemlock boughs. You want a few thousand early and fine that will sell at seventy-five cents per dozen. These should be wintered in frames. Transplant from seed bed to the frames five or six inches apart between the plants in the richest soil. When cold weather is expected cover with glazed sash. If frozen for months and covered with sash no harm will be done, but whenever a warm spell comes raise the sash.

If you are short of some varieties of geraniums you can begin to propagate them now. One advantage in doing this now is you get a good crop of cuttings, which will make strong early plants, and the old plants growing out of doors will break out and give another fine crop of cuttings by the end of September. Some men put all their cuttings at once into 2 or 2½-inch pots. When the weather is cool this is the most labor-saving way of doing it and I think makes the most sturdy plants, but if a very hot spell comes on you are likely to lose a large percentage of the cuttings, and therefore in hot weather I prefer to put them in a shaded but airy house in sand and keep moderately moist.

Look out that your sweet stevia does not draw up by being too close together; if they are in 5-inch now give them a 6-inch and stop them for the last time, and plunge them with plenty of room round them.

Poinsettias must not be left out and exposed to the cold nights after the end of this month. They have done well with us this year, as there has been no heavy rain storms to drown them. The great trouble with poinsettias with most people is the loss of their leaves, and then they are very unsightly, however large the bracts are. If the pots are very full of roots they must have a shift to carry them along in a healthy shape, for they have four months yet before the bracts are fully developed. If the cut flowers only are needed a much easier way to produce good flowers with fine foliage is to knock them out of the pots and plant in five or six inches of soil on a bench. Less care is needed and the flowers will be fine.

The old calla bulbs that flowered all last winter and have been resting outside will want attention now. The tops should be dried up by this time. Shake every bit of old soil off and look out for the little offsets, the size of peas and larger. If you want to increase your

stock you can make flowering roots of these the following year. For potting the old roots use a heavy, coarse loam, with a third of rotten cow manure, and add a little old lime rubbish to it. If well drained the calla will take any amount of water, so drain well. A few lumps of charcoal covered with green moss will do. Don't use sphagnum for any drainage; it soon rots and is useless for the purpose. After repotting the old bulbs in 5 or 6 inch, according to their size, I place them outside till end of September; they grow stockier and do better than if drawn up under glass.

The mignonette you sowed last month for winter bloom will be well up now. Thin out each little clump to three or four of the strongest plants, but not to one, for a grasshopper or some other friend may come along and eat that one. When they are beyond the reach of such an accident leave only one plant.

Buffalo, N. Y., Aug. 14. WM. SCOTT.

Seasonable Hints.

There are probably several diseases popularly known as spot. Scientifically the study is very interesting and we are thankful to science for all the aid and light we can get on the subject. Practically there is little difference to the grower whether spot defines a particular disease or a group. In fact all the fungoid diseases may be classed under one head and the same preventive measures taken for all—the liberal use of copper compounds both in the field and under glass. To let any of them become masters of the situation would be disastrous.

Rust seems to be of more recent origin. At least we have heard but little of it until within a few years. There has been a great deal of unnecessary anxiety in regard to it. While all possible measures should be taken to guard against it, it should be regarded in the same light as many other troublesome things—a pretty bad nuisance to be fought, but not to be feared. Do not rest in the false security of isolation and quarantine. The spores will travel for miles through the air, and by this means will become disseminated over the entire country as spot now is. We have in mind two cases of rust occurring by that means. Neither of the parties had ever received any rusty stock. One place was a half mile from any neighbor who had any rust. The other was fully five miles from any infected place, and the rust was found on small plants at two different times and in different places in the houses. In both cases the plants were destroyed.

For all fungoid diseases then we would recommend the application of fungicides at intervals, applied to the field plants if necessary, and by all means in the houses, commencing as soon as the plants are on the benches. It is not our object to advertise these goods. Any preparation of sulphate of copper ground into a fine powder is good, and should be applied with a bellows. For the houses at least we prefer the powder as easier of application. Liquid may be better for the field. Ammonia sulphate of copper is the best liquid preparation. One part of

saturated solution to one hundred of water. Fine sulphur is an excellent fungicide and is often used together with copper. Sulphide of potassium or liver of sulphur dissolved in water is highly recommended for spot. We think with due diligence and the proper use of these remedies or preventives no fear need be entertained that spot, rust or any other fungus growth will do the carnation permanent harm.

There is a fungus which affects the roots of the carnation, doing considerable damage at times. The top becomes yellow and finally dies. It mostly occurs in the field, and will spread from plant to plant. The ordinary fungicides fail to reach the evil. Whether all the plants that show a yellow and sickly appearance are so from this cause or not we cannot say, but the safest plan is to destroy all such stock no matter how valuable.

"Damping off" is a name familiarly applied to what may be a condition or a disease, we cannot positively say which. We do know, however, that we lose more plants from this cause than all other causes combined. It attacks the plants in the cutting bench and in all other stages to maturity, and after they are planted on the benches. We lose numbers of plants in this manner in the field, and far more of a wet season than during a dry one. The bark at the surface of the ground is first affected, and the disease, if such it is, works in and around the stem, girdling the plants, which die in consequence, although both above and below the injury they seem perfectly healthy. The strongest and most robust plants often suffer the most. The weak and sickly generally escape entirely. Some varieties are more liable to suffer than others. Two years ago we lost probably two-thirds of our Portias in the field from this cause, although the stock was very healthy in other respects. We lost very few, however, after removal to the house, and the same stock has been very free from the disease since. Grubs of the May beetle will often cut or girdle the plant below the surface, and injuries to the bark from careless hoeing and harrowing will often destroy the plant. But these cases are easily distinguished from what we are pleased to call "damping off." We have not been able to divine the cause, and we believe there is room here for original investigation. We are inclined to think the trouble is of fungoid origin, although microscopists to whom we have submitted the diseased plants have failed to detect any signs of fungus growth. We are having an experience at the present time that would point to the fungus of the cutting bench as lying at the root of the evil. In the latter part of the winter we potted off a fine lot of healthy plants from the cutting bench. These were set on a propagating table where fungus had been very bad. In a short time they began to damp off badly over the sand where the fungus had been the worst. At the present time these plants are damping off badly in the field. It looks very much as if the fungus had entered the balls and had been carried to the field, where it is finishing its work of destruction. Whether all cases of damping off can be traced to the fungus of the cutting bench we cannot say; but the mycelium of this fungus is often present when not suspected, and could be easily carried to the field in the manner indicated. We don't pretend to say we are right in this surmise, but the whole matter is clouded in mystery, and a good subject for our scientific friends to unravel.

Avondale, Pa.

W. R. SHELMIER.

The Seed Trade Convention

The Seed Trade Convention.

The eleventh annual meeting of the American Seed Trade Association convened in the Leland Hotel, Chicago, Monday, August 14, with about fifty members in attendance and President J. C. Vaughan in the chair. The eastern states were rather lightly represented but the west and southwest more than made good the shortage and the sessions were on the whole very satisfactory. Mr. H. L. de Vilmorin arrived on Tuesday and gave the convention two or three very interesting talks. Fourteen new members were admitted.

Among those present were the following: H. L. de Vilmorin, Paris, France; W. Atlee Burpee, Philadelphia; J. C. Vaughan, Chicago; Irwin B. Clark, Buffalo; C. L. Allen, Floral Park, N. Y.; W. W. Barnard, Chicago; Alfred J. Brown, Grand Rapids, Mich.; D. I. Bushnell, St. Louis; John A. Bruce, Hamilton, Ont.; A. N. Clark, Milford, Conn.; E. B. Clark, Milford, Conn.; J. L. Childs, Floral Park, N. Y.; S. F. Willard, Wethersfield, Conn.; C. W. Crossman, Rochester, N. Y.; Adam Currie, Milwaukee; Chas. Dickinson, Chicago; J. F. Dickmann, St. Louis; A. L. Don, New York; Frank T. Emerson, Omaha; W. H. Grennell, Pierrepoint Manor, N. Y.; E. T. Pierce and E. N. Page, Des Moines, Ia.; S. F. Leonard, Chicago; Robert Livingston, Columbus O.; R. Maitre, New Orleans; Albert McCullough, Cincinnati; Wm. Meggatt, Wethersfield, Conn.; F. H. Eberling, Syracuse, N. Y.; J. G. Peppard, Kansas City; J. C. Robinson, Waterloo, Neb.; W. Langbridge, Boston; Mr. Trumbull, Kansas City; T. W. Wood & Sons, Richmond, Va.; S. D. Woodruff & Sons, Orange, Conn.; C. B. Whitnall, Milwaukee; Samuel Wilson, Mechanicsville, Pa.; Fred S. Plant, St. Louis; J. M. Lupton, Mattituck, N. Y.; Manglesdorf Bros. Co., Atchison, Kan.

The sessions closed Tuesday evening with the election of officers as follows: President, W. Atlee Burpee; 1st Vice-President, D. I. Bushnell; 2nd Vice-President, S. F. Leonard; Secretary and Treasurer, A. L. Don. It is believed that the next session of the association will be held in Toronto.

Pedigree or Grade Races in Horticulture.

BY HENRI L. DE VILMORIN, PARIS.

[Read before the Seedsmen's session of the World's Fair Horticultural Congress, Chicago.]

The subject on which I intend to address you may seem at first sight to be a rather special and limited one. I trust, however, that upon consideration you will see with me that it is one of great importance and of the deepest interest. I claim for it a constant and all-powerful action in the life of garden plants when we are seeking the most improved races.

It is a well established fact that the life work of plants is to make the mineral wealth of the earth fitted for the use of animals and of man. Now it is clear that the plant's work can be done well or ill according to its more or less perfect fitness to its functions. It is, moreover, within the power of man to consider, and to some extent control, the efficiency of plants as regard to their work, to select and to increase the best only, and by continued selection to develop more and more the good qualities of each kind. In this way man raises races and varieties of plants which do their work best and quickest. Heredity is the lever by which the results of the study and care and perseverance of the raiser are fixed, so to

say, into the most valuable of the plants grown for man's use or delight. We have no more powerful means of improvement of vegetable forms. All the care, food and protection given to plants may make them larger and finer, but only selection among many of the same kind with the help of heredity can fashion an enduring race of plants with special good qualities for our farms, garden or orchards. Chance seeding may yield some very good finds, as sometimes a good hit is made by shooting at random. But no good marksman will, even after the luckiest of chance shots, dispense with the use of his eyes and judgment for the rest of the day. In the same way no experienced raiser will trust to chance in the choice of the seed from which he expects some precious results. He will gather it from one plant seen among many and will have good reasons to show for his choice.

It is plain that selection was not at all times done with such thought and skill as it is now; but ever since plants have been cultivated an evident improvement has been going on for our benefit, and fixed and valuable races of field plants, vegetables, flowers and fruits were known to the oldest nations and are mentioned by the oldest writers. Since the settlement of America a new field was opened for good work, which yielded a splendid crop of honor and profit to American as well as to European cultivators, and through them to their respective countries.

Let anyone who doubts the high value of selection look at our fine races of cabbages, kales, cauliflowers, kohlrabi and rutabaga and compare them with the wild cabbage of our western shores of Europe; let him compare our fine garden beets and our mangels to the wild beet of the Mediterranean shores; let him compare the tomatoes and potatoes of to-day with the wild South American plants and he will see proof that only human thought and skill have brought about such wonderful changes—many of them in our own day, many, on the other hand, some hundreds of years in existence. In the tomato and potato we have two distinct examples of garden races, viz., (1) those which are increased from seeds, as the tomato, and (2) those which are increased by division of a plant, as the potato.

Even where we divide the plant itself heredity is of some importance, as new varieties can be raised from seed only, and it is by no means indifferent to gather seeds meant for the purpose from one variety of potato or from another. Distinct groups of races are seen in the potato, as the Rose tribe, to which the Early Rose, Late Rose and many more can be referred. Just in the same way a nurseryman who sows pear pips in search of new varieties will take good care to take them from some old sort, the percentage of which gives good hopes of success. It follows then that even where increase by division is the rule the knowledge of the quality and history of a plant may be of essential importance.

WHAT HEREDITY IS.

Where selection is done with skill and care the improvement of many kinds of cultivated plants effected by its means is invaluable. The large pansies, the huge hybrid gladioli, the large flowered cannas were all brought from the state of small flowers to their present excellence in our own day by careful observers, who, watching every variation and keeping an exact record of the descent of all their plants, turn to the best account the wonderful action of heredity.

That plants are endowed with the

power of changing to some extent under altered and varying conditions no one will deny who knows even a little natural history. Such changes will occur in wild nature as well as under cultivation, and by the action of heredity will be transmitted more or less faithfully to the next generation.

But an all-important fact must be recognized and remembered. It is that in the wild state only such variations have a chance of enduring as give the plant in which they occur some advantage in its life. Many variations appear every year which soon disappear, because they are a loss, not a gain to the plant. Suppose in the wild state a potato plant with short

W. ATLEE BURPEE, PRESIDENT-ELECT OF THE AM SEED TRADE ASSOCIATION.

stems and late sprouting tubers in a mass at the base of the stem. Such a plant would not have any chance against rank growing and early shooting varieties and it would soon perish. Still, some such characters belong to some of our best potatoes. This is owing to the action of man, who throws his power into the balance when cultivating plants which are useful or pleasant to him, and who gives the weakest plant, if it is for some reason a favorite with him, all the advantage he can to make it thrive and answer his purpose. Most of the variations induced in our garden plants are not in favor of the plant if in a "free fight" with its kind in nature. All our improved roots, as carrots, turnips, beets, make an early and succulent growth for our own benefit, but not at all for their own good. If left to their fate to struggle with their own wild forms they would soon have to take a "back seat" and very likely soon perish. It follows then that varieties improved from man's point of view must receive kind treatment and richer food than wild forms of the same plant. The cultivated plant, like the domesticated animal, yields in a measure its powers of self defence to adapt itself to our service. Man must in return provide for its safety and nourishment. In the improvement of plants the action of man, much like influences which act on plants in the wild state, only brings about slow and gradual changes, often scarcely noticeable at first. But if the efforts towards the desired end be kept on steadily the changes will soon become

greater and greater and the last stages of the improvement will become much more rapid than the first ones.

I may relate here in a few words an unpublished experiment which I have been conducting for more than twenty years, from 1872 to the present year. It has consisted in cultivating one of our parsley-worts (*Anthriscus sylvestris*), a European weed, in order to change its slender and much forked roots into fleshy, straight and clean roots, say like those of the parsnip. Among the first batch of roots raised from wild seeds a dozen were selected with a tendency in their roots to larger and straighter bodies. Each root was planted separately and its seed harvested separately. Of the dozen lots obtained eight or nine were discarded at once and roots were selected only in such lots as exhibited some trace of variation. Again a dozen roots or so were chosen, a drawing made of each root, which was afterwards planted separately. I have sketches of all the roots selected, so that it is possible to follow all the stages of variation of each plant living at this day. For the first ten years the changes were slight, but now they are more and more marked with every generation, and in some of the lots the straight and smooth roots are the most numerous.

My object was not to create a new vegetable, as the roots of *Anthriscus sylvestris* have such a strong taste of camphor as to be quite uneatable, but simply to show that careful and continuous selection could transform a wild plant in years that do not equal a quarter of the span of many human lives. Like results had been shown by my grandfather with the wild carrot, only its results were open to controversy as to possible crosses between garden varieties and the wild strain. No such objection can be raised in the case of my wood parsley-wort.

HOW IT WORKS.

Although heredity is an ever-present and active agent in the transmission of qualities and characteristics in organized beings, its mode of action is not so simple as at a first glance it might seem to be. That like breeds like is a commonly admitted fact, but there like must be taken in a rather broad sense, and the fact that some differences may occur between the parent and the offspring is at the bottom of all improvement of plants by selection.

A being born from one or two of the same kind will be like his parent or parents. But if the parents, although of one kind, were not exactly like one another how will the descendant look? Will it take after the one or after the other, or blend the features of both? And again, if each of the parents comes from two different ancestors which of the four will take the lead in the form and character of the new being?

The network of lines of attraction which would induce a living organism, plant or animal, to be like every one of its ancestors can scarcely be unravelled. Still, the consideration of the various influences acting on an incipient organism can be pretty accurately summed up in direct heredity, which tends to make the new plant or animal to resemble its immediate progenitors, and atavism, which induces it to be like the mass of its removed ancestors. I omit for the present the idiosyncrasy, which is the tendency in the new plant to combine the inherited characteristics in some special manner adapted to its own particular wants. If the parent was like its progenitors then all the influences work the same way, and there is every chance of perfect fixity in the series of beings born in succession. But

if the progenitors for one or more generations has swerved from the characteristics of the ancestors heredity and atavism will come into conflict, and the outcome can not be predicted surely.

Some hints on probabilities may be had from an experiment conducted by my father on two varieties of the *Lupinus hirsutus*, the one with blue and the other with pink flowers. The conditions were in this case very well adapted to the study of the action of heredity, the flowers being in the lupine not only hermaphrodite, but also cleistogamous, so that a seed is the produce of only one bloom of one plant. Two lots of seeds were sown to begin with, some of the blue and some of the pink strain. Most plants turned out true, still a few with pink flowers were found in the lot of blue, and conversely some blue among the pink ones.

In the following year seeds of the true plants were sown again, and along with them seeds of the "rogues" found in each lot. In the latter the greater proportion of plants followed the color of the parent plant, but a great many more showed the alternative color than was the case in the original lots. Seed from blue and pink flowered plants of the third generation were sown again, every possible combination in the relations of the ancestors as to color and distance being tried as much as possible and the number of blue and pink flowered plants being carefully noted in each case, and the experiment was carried on for several years. Though no exact rules can be arrived at from experiments with living things from the tabulated results of the experiment the following inferences can be drawn:

1. The tendency to resemble its parents is generally the strongest in any plant.
2. But it is notably impaired if coming into conflict with the tendency to resemble the bulk of the ancestors.
3. This latter tendency (called atavism) is constant, though not very strong, and scarcely becomes impaired by a series of generations passing by without a reversion to the ancestral type having taken place.
4. On the contrary, the tendency to resemble a near progenitor (two or three generations only distant) very soon becomes obliterated if the said progenitor be different from the bulk of the ancestors. From this it will be seen that choice new races can be raised quickest and with the smallest amount of labor where all needless conflict in the hereditary powers is avoided.

HOW THE ACTION OF HEREDITY CAN BEST BE TURNED TO ACCOUNT.

But it may be rightly remarked here that it must be shown how variations can be obtained before we are shown how they can be made permanent.

It is admitted by all observers that plants, being immovably fixed in the ground by their roots, and consequently prevented from seeking favorable and from avoiding untoward circumstances, are endowed by way of compensation with the power to adapt themselves to some extent to different conditions as to soil and climate. The manner in which plants so adapt themselves is most admirable, but it is not here the place nor the time to consider it. Suffice it to say that the changes in the size, position and anatomy of their various organs appear to be much called up by than produced directly by the changed conditions. The important point in the present case is that variations in the special characteristics of a cultivated race may and do occur occasionally, and that such variations can be made permanent and still

magnified by the process of selection. To wait for them to appear among seedlings is the simplest and most ordinary process. But their appearance can be hastened and made more probable by the selection of seeds from a plant showing already some trace of variation, or by means of a cross with some other variety of the same species. As soon as a distinct variation has made its appearance the work of selection begins. The essential thing is to secure a deviation from the old type of the plant under experiment. It matters little whether such deviation takes place in the desired direction or not. Some authors even advise the experimenter to look for any change at the first stage, and at the next one for the greatest possible deviation from the first change in any direction except a reversion to the old type. This may be useful as far as the appearance of new forms is concerned, but if adhered to too long it might make the fixation of the new forms rather difficult and slow by breeding continuity out of the new race.

Whatever the cause of the original variation was, action of the plant's own tendency to vary, or some external cause, or a cross of pollen, the next thing to be done is to make the variation permanent by selection. This is sometimes very easy, the new form becoming at once perfectly true and fixed. A case in point occurred several years ago in my trial grounds at Verrieres. One plant of *Clarkia elegans* with pure white double flowers was discovered among a number of the same species with double purple flowers. It was singled out of the seed sown the next year, when every plant raised gave only double white blooms, and it has never since been known to give any but pure white flowers. If such cases were of common occurrence they would make the task of the breeder of new varieties a very easy one. Unfortunately, they are very rare exceptions, and the tendency of new seedling forms is rather to revert frequently and rapidly to the original type. Great attention and vigilance must be exerted to counterbalance this tendency to reversion. The best and most useful plan is not to mix together the seeds of the selected plants in case several were singled out, but to sow the seed of each separately, as the several plants selected may be endowed in a very unequal degree with the power of transmitting their own characteristics to their progeny. Now the principal object and the principal effect of selection if well conducted is to effect a complete transmission of the qualities we seek of any given race. Its aim must be in consequence to eliminate any plant which is not fit to reproduce itself "true."

It is often observed that in such cases when the seeds of several plants selected in the same batch of seedlings are sown side by side and separately the one will come up true with only a very few or no "rogues" at all, while others will give a very medley of plants. If further selection be made only from the lot that came up true the new variety may be considered as already fixed; whereas many years of cultivation and "roguing" may be required to bring it to anything like purity if progenitors be taken from the lots in which numerous variations occurred. Fixity of character is of great importance to garden and field plants grown from seed, and the tendency to fixity should be inbred in plants just as the tendency to earliness or to hardiness. The power of transmitting their own qualities to their progeny is just as hereditary as any other qualification, and no effort should be

spared to make it one of the points of a new race. Breeding from single progenitors appears so far to be the safest and shortest way to the proposed end.

Cross-breeding greatly increases the chance of wide variation, but it makes the task of fixation more difficult. It, however, gives the raiser the only means in his possession to unite in one the qualities of two different plants while discarding their weak points. All the different qualities of the two parents seem to unite in the most varied combinations in the cross-bred products. In this way plants are often found which inherit most of the good points of both parents, while some others sum up the defects of both. This I repeatedly observed in rearing cross-bred wheats. An occurrence not unfrequently observed in cross-bred plants is that some character belonging to one of the parents is magnified in the progeny. For an instance Mr. Charles Naudin observed in crossing *daturas* that the cross of a slightly prickly variety with another kind which had smooth stems resulted in the raising of a decidedly prickly hybrid.

In framing the character of the progeny the action of each parent is often very unequal, according to the power of each in transmitting its characters. The one that is better endowed in that respect stamps its features more firmly on the cross-bred plant. Discussions have arisen on the influence of the male and of the female progenitor on a cross. I believe that the stronger organism of the two, the one rather which is better endowed with the power to transmit its characters, will predominate in the progeny whether it comes from the male or the female parent.

One trait that makes the fixation of cross-bred plants difficult is in some characters of both parents breaking out in different parts of one and the same plant, instead of being, as we could wish, blended together. In cross-bred peas, for instance, which were raised from a white-seeded and a green-seeded parent, it often occurs that at the second or third generation pods are produced which contain mixed white and green seeds. In the same manner round and wrinkled seeds are found in the same pod. This is a great difficulty and an almost sure sign of further variation, as a plant showing such breaks can not be depended upon to give rise to a uniform progeny. In many similar instances recorded in my books of experiments the green peas gave plants with white seeds and the white ones with green. You can scarcely expect a plant which is not constant in its own parts to be constant in its progeny.

The unity in character of any single plant is the main factor in the work of pedigree or grade breeding, and I wish to lay especial stress on that point, which I think of paramount importance. The consideration of the qualities or defects of a plant taken as a whole, not of minor parts, should guide the raiser in his work. Of this I am convinced from experience, and I may be permitted to give a few facts in support of my opinion.

The advice is often given in horticultural books to take the seeds from some particular portion of the seed-bearing plant in order to secure a better result. In German stocks, for instance, it is a common belief that the seeds of pods taken from the middle or from the base of the main stem will give a larger proportion of plants with double flowers than if taken from the top of the same or from side shoots. I many times tested the idea and it always proved a fallacy. All the pods on a plant give an almost exactly equal proportion of plants with

JAPANESE FLORAL ARRANGEMENTS

double and single flowers, no matter what part of the plant they may be gathered from.

A real difference is in the percentage of single and double flowers from various plants of the same variety. In this way very wide differences sometimes occur, but not in the case of seeds taken from various parts of the same plant. I tried an experiment with seeds of *Chrysanthemum carinatum* gathered on double, single and semi-double heads, all growing on one plant, and found no difference whatever in the proportion of single and double flowered plants. In striped verbenas an unequal distribution of the color is often noticed; some heads are pure white, some of a self-color, and most are marked with colored stripes on white ground. I had seeds taken severally from all and tested alongside one another. The result was the same. All the seeds from one plant, whatever the color of the flower that bore them, gave the same proportion of plain and variegated flowers. No more proof, I think, need be given that selection, which is all-important in the case of seeds from different plants, is of no importance as regards the different parts of any one plant on which seeds may be borne.

No limit can be fixed as to the improvements which may be expected from care, thought and selection. The gains of the last dozen years may surely be taken as

the forerunners of better things. It is clear that no very important additions to our cultivated plants are to be expected now from the discovery of new species, but an unlimited field opens before the raiser of new and improved forms in all our garden flowers and in fruits and vegetables. The recent success of European raisers of new begonias, of hybrid gladioli and of large flowered cannas are equalled by the gains of the American raisers of chrysanthemums, of garden beets and of tomatoes. I may add by way of conclusion that much good may be expected from the more and more frequent exchange of strains between the old and the new world. Such complete changes of soil and of climate frequently give rise to variation, and so either by subtle changes one cannot see the cause of or by well considered crosses, American and European varieties of our useful or beautiful plants may give rise in their turn to more numerous and useful variations than would have occurred had these races been confined exclusively to the country of their origin.

Japanese Floral Arrangements.

The accompanying engraving is from a photograph of flowers arranged in the typical Japanese style by Mr. Shibota Tomiyami, a nurseryman of Kobe, Japan, now at the World's Fair.

The flowers used were cherry and peach blossoms, camellias, Mouton pæonias, chrysanthemums, irises and aspidistra leaves.

Lest our readers be stunned with the idea of having all these flowers available at one time we shall have to say that some of them were artificial.

The upright flower holders are of bamboo and are of the style used by the professional Japanese florists. The arrangement followed is also that of the professional florist of Japan.

Philadelphia.

The convention of 1893 is a thing of the past, and considering the distance from the large horticultural centres that are commercially interested the attendance was very good. Chairman John Westcott of the committee of arrangements had to secure a larger car, so as to better accommodate the out of town brethren who did not make their intentions known until almost train time. Quite a number of the boys were at the station to see that the delegates got off in good shape. A safe journey and a good time was wished to everybody as the train pulled out and Captain Anderson was admonished to bring that cup back at all hazards. Alas! alas! how cruel is fate. At Harrisburg the delegation from

Lancaster and Mr. Dillon of Bloomsburg were taken as well as Messrs. Weidy and Seidewitz of Baltimore, and a delegation from Washington composed of President W. R. Smith with Messrs. Gude, Clark and several others as a body guard. To add grace to the party some of the members brought their wives and daughters along, there being seven ladies in all.

Everybody was merry and notwithstanding the dust and the heat seemed to enjoy the trip very much. A number of the boys found the smoking room a very attractive place, and judging from the close attention paid to the various phases of the game, we mean subject, under discussion, we feel sure their deliberations must have been profitable to at least some of them.

At Indianapolis, Gurney Hill, and Mr. Evans of ventilator fame were taken aboard. Finally exactly on time our train steamed into the depot at St. Louis and we were given a hearty hand shake and welcome by the reception committee, among them being John M. Hudson, who seemed very glad to see his old Philadelphia friends, and was only sorry that more of them were not along.

St. Louis is a very fine city, the streets are wide and well paved, the street car system, Trolley and cable is admirable, as fine as any we have ever seen, while the public buildings, large office structures and stores, are modern and imposing structures. Our stay between the meetings of the convention was made as pleasant as possible by the members of the local club, who were untiring in their efforts give the visitors a good time. The carriage ride through the parks and suburbs, the visit to the beautiful Shaw gardens and elegant collation were very much enjoyed, while the Anheuser-Busch reception was pronounced a rousing success. The trip to Brownhurst on Saturday was also a very delightful occasion.

There was also another event to which some of the members of the various florists clubs of the country had been invited to take part. A certain few from New York, Philadelphia, and Chicago joined the St. Louis boys and entered into a howling contest on the alleys of the Pastime Athletic Club. It looked before this game as if the limit would be reached by some of the bowlers, as the pins were only ten inches apart, but ten pins is a very deceptive game, and our own Wm. K. Harris was the only man to come near the three hundred mark, making 240 pins in his first game and thereby bringing one prize to Philadelphia a very pretty scarf pin for the highest individual score. In this game Mr. Harris had seven in the first frame and then made eight straight strikes.

In the first game New York defeated us by only ten pins, but in the next two we were nowhere; the head pin could not be located with any certainty and New York won as they pleased. If all had done as well as Captain Anderson and Mr. Harris, the latter making within four pins of the second man in the total of the three games, the cup, like the cat in the song, would have come back. Still it is not gone forever; it is simply loaned, and when that case is good and ready it may yet grace the club room along with the other trophies. During the gameluncheon was provided for the bowlers and the visitors and a quartette of members of the Pastime Athletic Club played a match of handball to show the visitors the game.

On Saturday night there was a general illumination by the Fall Festivities Association. All along the sidewalks of the principal streets there are arches of gas

lights with opal shades, and at the intersections of the streets there are large arches of gas and electric lights. The effect when these arches were lit up was brilliant in the extreme, and the streets were thronged with people attracted by the display. We understand they are lighted every evening after the opening of the Exposition each fall. While the illumination was still on a start was made for the depot and at 9:10, after hand shaking with a number of the club who had come down to see us off, the train pulled out and a visit which will ever be full of pleasant remembrances was over. K.

Eryngium Amethystinum.

A flower spike of the true variety of this plant was recently received from Rea Brothers, No. wood, Mass. It is remarkable for the metallic blue tint of the flower heads and stem. The senders inform us that the variety generally distributed as *E. amethystinum* is either *E. planum* or more rarely *E. alpinum*. On well established plants the flower stems reach a height of four feet.

ATHENS, GA.—The eighteenth annual session of the State Horticultural Society opened here August 2. There was a good exhibition of fruit and vegetables.

ATLANTIC, IOWA.—The Silas Wilson Co. has been incorporated here, with a capital stock of \$150,000. They will do a general nursery business on a large scale.

WEST CHESTER, PA.—The greenhouses belonging to Hoopes Bros. & Thomas were seriously damaged by fire August 14, entailing considerable loss.

THE TRANSACTIONS OF THE Massachusetts Horticultural Society for 1893. (Part I) recently received gives the proceedings for the first three months of this year, including a number of essays.

PITTSBURG.—The Pittsburg and Allegheny Florists' and Gardeners' Club had their annual picnic at Ross Grove last Monday, and a most enjoyable time was had by all who participated.

Do YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany any order. Plant ads. not admitted under this head.

SITUATION WANTED.—By an experienced florist and gardener. Address E. HAY, care Mrs. Josephsen, 20 No. Green St., Chicago.

SITUATION WANTED.—As foreman in commercial place; age 30; married. First-class references. Address ROSEN, box 61, Providence, R. I.

SITUATION WANTED.—By young man, as gardener on private place; can come with good reference. Address CHAS. RUSCH, 30 Sherman St., Chicago.

SITUATION WANTED.—By florist. In growing roses, carnations, palms, ferns, orchids, smilax and forcing bulbs; single; 18 years experience. Address L. M., care American Florist, Chicago.

SITUATION WANTED.—By a young married man, small family, either private or commercial place; 10 years experience; can give first class references. Address C. O. ERICKSON, Bowmanville, Ill.

SITUATION WANTED.—By first class florist, commercial or private, German, married, small family; 15 years experience in all branches; good references. Address A. R., care American Florist.

SITUATION WANTED.—By a good florist as foreman or assistant—commercial place preferred—Many years' experience in the business. Good recommendations. Address W. F., care Am. Florist.

SITUATION WANTED.—By a young florist, 7 years experience in growing plants and cut flowers, industrious, competent, sober; best of reference. Address L. G. BARBER, care E. Yd. Paint shop, Ft. Wayne, Ind.

SITUATION WANTED.—By first class German florist and landscape gardener, commercial or private; 22 years experience; married, small family; age 36; best of references. Address C. B., care American Florist, Chicago.

SITUATION WANTED.—By a first class florist, who understands the business thoroughly in all its branches; 11 years experience; good references; Scandinavian; single. Address JOHN LANG, Lakewood Greenhouses, Minneapolis, Minn.

SITUATION WANTED.—By a first class florist and gardener as foreman or head gardener, commercial place preferred; 30 years experience in all branches; Austrian; married, no family. Address T. A. KASCHKA, 315 8th St., N. W., Washington, D. C.

SITUATION WANTED.—As foreman and salesman, age 29; good grower and forcer, also first class maker-up, and of good address; 15 years practical experience in England and Germany; speaks English and German fluently; good testimonials. Address G. C. Box 623, New Rochelle, N. Y.

SITUATION WANTED.—By a single man, as foreman and propagator for a commercial place; have had 7 years experience in same; 15 years experience in growing plants and cut flowers; can give best of reference. Address GARDENER, care American Florist.

SITUATION WANTED.—By single, young, practical florist and gardener; wide experience in both branches. Also in mushroom culture, fruit growing and landscape work. Life experience. Last 5 years as head florist and gardener in large public institution. Not afraid of work. Best of references. Prefer a private place. Address H. SWABY, box 56, Clifton, Green Co., O.

WANTED.—A Hitchings or Wilks boiler, medium size. Address PFUND BROS., Oak Park, Ill.

WANTED.—A handy man to take charge of mushroom cellars. Inquire for particulars at once. Address HERMAN CLAUSEN, Gypsum, Ottawa Co., Ohio.

WANTED.—An intelligent young man with practical experiences desires to enter into a reliable business, which, if satisfactory, he could eventually buy. Address B. S., care American Florist.

WANTED.—On private place with greenhouses, a gardener of good habits, single man, or with wife competent to cook; must understand care of conservatory, roses, orchids, etc. Address W. H. CHADWICK, 1814 Belmont Ave., Chicago.

FOR RENT.—12 greenhouses, at moderate rate. Address YOUNG, Narberth P. O., Penna.

FOR SALE.—Some very nice fig trees in painted tubs, cheap. Address F. KNIESCHE, 18 Hawthorne Ave., Chicago.

FOR SALE.—1000 feet of four-inch pipe and fittings in good condition. Price \$80 on board cars. Address B. L. Clark, West St., Randolph, Mass.

FOR SALE.—1000 ft. 4-in. hot water pipe and fittings, mostly in 5 ft. lengths, connected with red lead, 6 cts. per foot. Address JAMES CHALK, Norristown, Pa.

FOR SALE.—1500 feet of 4-inch pipe—good as new—and also fittings. Price \$10.00 per 100; \$80.00 per 1000. Address MRS. GEO. WALDBAUER, Saginaw, Mich.

FOR SALE.—The rarest chance to procure a well established business. Only \$300 cash required; in an excellent neighborhood. For particulars, address ISAAC A. PASSMORE, Oxford, Pa.

FOR SALE OR LET.—A valuable florist establishment near depot. Apply JACOB MENDEL, Nyack, N. Y.

FOR SALE.

500 Perle Roses in 4-inch pots at \$8.00 per 100. Also 500 Lizzie McQuinn Carnations, field grown, strong plants, at \$5.00 per 100. Address JAMES CHALK, Sandy Hill Greenhouses, Norristown, Pa.

FOR SALE. THE OIL CITY GREENHOUSES, OIL CITY, PA.

4,500 feet of glass, heated with No. 7 Furman steam boiler. Houses in good repair and well stocked. A bargain.

FOR SALE OR RENT.

Rose and cut flower growing plant containing about 35,000 square feet of glass; houses heated by steam and hot water; all in good condition; well stocked with roses, ferns, palms, etc. Only 18 minutes ride from center of city. If you mean business, address FLORIST, care Chas. E. Prather, Louisville, Ky.

FOR SALE OR TO RENT.

The following greenhouse property, situated on the outskirts of Springfield, the City of Houses; or will sell Greenhouses, Stock and Fixtures and give ten years' lease of 2 acres land. Ten houses in all—5 houses, 10 feet wide, 65 feet long; 4 houses, 18 feet wide, 65 feet long; 1 house, 18 feet wide, 65 feet long. Steam plant! New double Florida Boiler. Stock in good condition, with a large and extra good home market. This is an opportunity in a life-time, as present owner has other interests to look after. If you are looking for a chance, apply at once to

N. D. WINTER.
5 Elm Street, SPRINGFIELD, MASS.

HAIL ASSOCIATION REPORT.

SECRETARY'S REPORT.

The elements in general and hail storms in particular have wrought disaster to growers during the past year. Some idea of the magnitude of losses by hail may be obtained when it is stated that in the five years preceding August 1, 1892, the Florists' Hail Association paid a total of \$3,028.11 for losses by hail. For the year ending August 1, 1893, the Association has paid \$5,856.83, or nearly twice as much in one year as in the preceding four years. Forty members have been able to replace their glass without loss and this has been accomplished without hardship to a single member. "In union there is strength," and the force of the aphorism has been especially illustrated this year in the working of the Florists' Hail Association. The following losses have been paid since August 1, 1892: To Mrs. Ella Campbell Wilson \$229.88, to Seeger & Hiesekorn \$206.25, to C. A. Weddigen \$13.45, to Bruenig & Aue \$18.12, to Nathan Smith & Son \$7.74, to Chas. Beyer \$43.75, to Oklahoma Floral Co. \$430.00, to Chas. J. Juengel \$10.10, to Draper & Son \$170.50, to August Mirring \$23.60, to Andrew Meyer \$31.35, to Ed. Quinn \$180.00, to F. J. Fillmore \$238.64, to Arthur Thomhill \$12.50, to Fred Dorner \$379.38, to J. A. Heller \$22.58, to Ed. Paule \$63.10, to Gottlieb Teufel \$6.56, to G. M. Kellogg \$1,225.19, to A. N. Kinsman & Co. \$36.25, to C. C. Murphy \$5.95, to N. S. Griffith \$192.95, to J. R. & A. Murdoch \$77.10, to J. J. Schumacher \$31.20, to Gus Brunner \$69.15, to Arthur Thomhill \$20.55, to Theo. Noehle \$1.50, to Fred Burki \$62.56, to the Heite Floral Co. \$193.42, to E. Manthey \$149.85, to Chas. Bertschy & Bro. \$55.58, to Mrs. M. J. Chaffin \$50.60, to John G. McOtty \$86.83, to Henry Bertrand \$6.42, to Herman Schlaactler \$50.00, to J. J. Habermehl & Son \$1,393.90, to C. Eisele \$15.43, to C. Humfeld \$16.60, to F. S. Krebs \$18.15, to Mrs. J. F. Gorhring \$7.15. From the total amount of losses should be deducted the amount of \$81.76 which was reserved for re-insurance.

On August 1, 1893, the Florists' Hail Association had 496 members in good standing. The amount of glass insured was 4,830,780 feet, of which 2,247,012 feet was single thick and 2,583,768 feet was double thick.

An extra one-half insurance has been placed upon 63,261 feet of single thick glass and 117,396 feet of double thick glass. An extra whole insurance is carried upon 379,509 feet of single and upon 555,511 feet of double strength glass, making it equivalent to a single insurance upon 5,846,128 square feet of glass. The amount received for insurance during the past year is \$1,406.69, of which \$575.47 is membership fee and \$831.22 is assessment fee.

One assessment has been levied during the year, known as the fourth assessment from which the Association received the sum of \$3,379.16.

The total disbursements have been losses \$5,856.83, expenses \$916.02, bond purchase \$510.48 and \$6.25 allowed on guarantee fund, leaving in the hands of the treasurer for reserve fund \$907.12, for assessment fund \$1,072.08. The reserve assets consists of \$2,500 in bonds in addition to the membership fee as above reported, making a total reserve fund of \$3,107.12.

Although losses at one time came thick and fast the business of the Association has been conducted without touching the reserve fund at any time, and it is with pride that the secretary can report that when prompt action was necessary every official in the Association responded without a moments delay. The response of members to the emergency assessment levied was so prompt as to inspire all with confidence in the stability of the Florists' Hail Association, and when it is thoroughly understood how easy it is to aid each other in case of disaster through the medium of the Hail Association the membership will assume colossal proportions.

The percentage of loss for the past year has been one square foot of single thick glass to 37,6604 square feet insured, and one square foot of double thick glass to every 93,287 square feet insured. 59,665 square feet of single thick has been paid for during the year, and 27,712 square feet of double thick. From Texas to Manitoba and from Wyoming to Maine hail has fallen with such violence and frequency that the "hail belt" has been obliterated.

J. G. ESLER, Secretary.

SMILAX WANTED.

Wanted, lowest estimate on 3,000 Smilax. Will trade some Calla Lily bulbs. Address
W. J. DOWNES, 906 Sherman Ave., Evanston, Ill.

25,000 FINE FERNS.

Our stock of young Ferns is greater this season than ever. The plants are just in proper condition to shift on into 3-inch pots for use in jardinières and fern dishes during the fall and winter.

During the past five years there has always been a great scarcity of this stock from the holiday season on, and this year will be no exception. You cannot go amiss by laying in a stock now and growing them on.

As our stock is nearly all grown in open frames, it is in a well-hardened off condition and will stand shipment by freight, except to very distant points, thereby saving heavy express charges.

Injury to Plants by a Trespassing Dog.

It is quite a common thing for persons to be annoyed by other people's dogs breaking or injuring their plants. In such cases it is not lawful to kill the dogs, says the Supreme Court of Michigan in the case of Tenhopen vs. Walker. The legal remedy is an action against the owners for damages which the law affords in all cases for the destruction of property caused by the beasts of others. In the case where this was decided the owner of a certain residence, who had a pond of lilies in front of his house, had the same on several occasions injured by dogs wallowing in the pond, which laid open to the highway. Wrought up by this when he saw from an upper window two boys, or young men, going along the highway accompanied by a dog owned by their mother and two other dogs, and the first mentioned dog approached the pond apparently with the intent to slake its thirst, he went down into the lower hall, got his gun, and, returning above, shot the dog from the upper window. The dog was a valuable one and the court awarded its owner \$225 damages for the killing of it. The court said that the owner of the dog was entitled to recover actual damages, which would consist of the value of the dog at the time it was killed; and that, even if the dog was committing a trespass at the time it was killed, and, in the opinion of the man who killed it, was about to destroy some of his plants, it would not be a justification for the killing, or in any way mitigate actual damages, because the law afforded the remedy hereinbefore referred to. The court further said that, while actual damages could not be mitigated by the fact that the man had theretofore been annoyed by other dogs, yet, if it was found that he had been so annoyed, or if he believed at the time that this dog was actually in the act of destroying some of his property, the jury might consider whether these facts could entirely rebut malice; and if, notwithstanding these facts might be found to exist, they believed that he was actuated by malice, they might even then award exemplary damages; for, if he willfully and maliciously did the killing, exemplary damages would be recoverable. The jury may or may not have found that the dog was killed willfully and maliciously, but there certainly was evidence which would have justified them in finding the act willful and malicious. In cases of malicious injury it is not necessary that there should be actual enmity towards the person injured. Dogs in Michigan, as in many of the other states, have value, and are the property of the owner as much as any other animal which one may have or keep.

Denver.

The regular meeting of the club was well attended. Those absent were mostly members that have had to look for work in new lines, for since silver has gone everyone has had to cut help in every way. The market has gone to keep company with silver and six national banks. Notwithstanding the hard knocks that we are receiving every concern is making ready for a big output this winter.

The chrysanthemum show will be a grand success as far as products are concerned, if not in attendance. I have great confidence in the stock already under way, for I could not find anything to stand by Mr. Adams', Mauff's or Beech's plants while in Chicago. May be they were there, but hunt as I would in all imaginable places, I still thought that Denver was as usual not far behind.

Haul & Thompson are adding two new houses. They are comparatively a new firm but are old hands, and are doing all they can to help make the flower loving public know what Montclare is and where it is.

The florists here are all interested in the poultry business. Grasshoppers are a curse this year but chickens are a sure cure. Two or three about a month old may be found in very many chrysanthemum houses, and at the Waterbury place three are holding forth in the rose house.

LYLE.

FOR SEED TRADE news see page 38.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

WE request subscribers to make remittance by draft or money order when renewing subscriptions, and to keep a record of the numbers and dates of same. This is to guard against losses in the mails.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

PANSIES.

If you plant pansies, it will be to your advantage to plant at least one hundred of the beautiful strain I am offering for sale, as a trial. The flowers are very large and beautifully marked. Fine plants ready Sept. 1 and after, at

St. Louis.

The florists from all over this broad country have come and gone and the convention of 1893 is a thing of the past; to the St. Louis florists, although it has been a busy time, it has also been a most pleasant one, giving us a chance of making and renewing pleasant acquaintances as well as enabling us to offer the hospitality of our city, in return for the many enjoyable times had in attending the various conventions of the S. A. F.

The Washington and Philadelphia delegations arrived Tuesday evening, the 5th, with President Smith; the Chicago, New York, Boston, and Cincinnati people came in on Wednesday morning and most all were quartered at either the Southern or Rozier hotels, these being favored as a person desired American or European plan. The attendance as a whole was not as large as was expected, but taking all things into consideration was very fair.

The sessions were well attended and all the papers were listened to with marked attention, calling forth considerable discussion. Attending the entertainments provided by the local club occupied all the time between sessions and consisted of a carriage ride Wednesday, passing the new Union Depot, and also through La Fayette, Tower Grove and Forest parks and to the city again by way of Lindell avenue. A visit to the Missouri Botanical Gardens upon invitation of the directors on Thursday where a lunch was served, after viewing the gardens; for Friday afternoon a trip to the Anheuser-Busch Brewery where all were shown the workings of the largest brewery in the states, and where a lunch accompanied by unlimited liquid refreshments of a certain kind was served. And in the evening a trip by all the ladies and several gentlemen under the guidance of Mr. Harry Chandler to the Southside park where racing is indulged in every evening with the aid of electric lights.

On Saturday the bowlers held high carnival at the Pastime Athletic Club, the New York team winning both the Spaulding and St. Louis cups. The prize for the highest individual score however went to W. K. Harris of the Philadelphias, which team also ranked second on average score, St. Louis and Chicago following in the order named. Washington entered the evening before but did not show up to compete. In the afternoon a trip to Brownhurst upon invitation of Mrs. A. S. Brown was taken by most all the members and was much enjoyed. Most all delegates left about 8:30 Saturday evening the special late train being abandoned, and they were thus enabled to see only a part of the illumination of the city, which was to be regretted as it was worth seeing.

Taking it all in all the convention may be said to be a success and the only hope expressed here is that our visitors enjoyed their visit as much as we enjoyed having them with us. R. F. T.

FLORISTS' LETTERS.

WERE STILL IN IT. DESPITE REPORTS TO THE CONTRARY.

The claim in patent No. 465,331, held by the Boston Florist Letter Co., reads: "A florist's figure stamped from a sheet of material, appropriately colored, and having a flock made of fragments of flowers, more or less comminuted, substantially as described."

My letters are manufactured of nothing covered in above claim. These letters are made in three styles, 2-inch standard, 3-inch heavy and 4-inch standard. Price 2 cts per letter; each letter having a fastener attached to the back of the letter; not covering the face of the letter. Seeing is believing; therefore if in need of letters send for samples of the "much interior" and judge for yourself. Chas. F. Montgomery, 106 Washington St., WILMINGTON, PA. SALTER BROS., Rochester, N. Y. Agents for Western N. Y.

Chicago.

A great many of our florist friends are in town this week, home-ward bound after the convention. On Sunday Lincoln and Washington Parks were largely visited by them, and all unite in praising the beautiful conservatory and natural planting of Lincoln Park, and the formal bedding at Washington Park. On Monday the florists were scattered all over the Fair, from the gunboat to the Ferris wheel. Among those who were registered in Chicago were: W. J. Stewart, Boston; W. A. Manda, Short Hills, N. J.; Grove P. Rawson, Elmira, N. Y.; Robt. Craig and wife, Philadelphia; W. H. Taplin, Holmesburg, Pa.; Wm. Schrav, St. Louis; ex-President W. R. Smith, Washington; F. W. Thielman, Brooklyn, N. Y.; Wm. Plumb, West Atlanta, Ga.; Joseph E. Monaghan, Quebec; W. L. Bates, Topeka, Kas.; R. Maitre, New Orleans; H. Dailledouze, P. Dailledouze, J. Sweiser, Flatbush, N. Y.; Robt. Kift and wife, Philadelphia; E. Hippard, Youngstown, Ohio; P. O'Mara, New York; H. Sunderbruch, Cincinnati; J. G. Esler, Saddle River, N. J.; Chas. Rauss, Detroit; Karl A. Kumpf, Buffalo; Frank McMahon, Seabright, N. J.; C. L. Allen, Floral Park, N. Y.; John Eblen, New Orleans; John Barclay, with John Gardiner & Co., Philadelphia.

Mrs. H. H. Berger and daughter, San Francisco, arrived in the city on the 14th inst. and are at the Auditorium Hotel. They missed the St. Louis convention, but will attend the Horticultural Congress and visit the World's Fair.

A party of the visiting members of the Society of American Florists called upon Director General Davis on Monday afternoon, August 13, and had the pleasure of a very pleasant informal interview, in which the Director General expressed his pleasure at meeting them, and spoke in words of high appreciation of the importance of floriculture and gratification at the work which members of the S. A. F. had done for that particular department of the World's Fair.

The Horticultural Society of Chicago will give a reception and banquet to the prominent people in attendance at the Horticultural Congress, Friday evening (18th inst.), at 7 o'clock, at the Union League Club.

Business is altogether flat and unprofitable, and there is nothing doing at all. Flowers are rather poor all around. July was not a very dull month compared with some previous seasons, but August is very flat. Roses are improving a little, though still small, but stock from young plants is better than it was. O. P. Bassett is sending in some nice stock, Beauties, Albany, etc., and also a few Mme. Caroline Testout. Perles continue fair in quality.

Asters are overwhelmingly plentiful, and sell but poorly; some dealers say less than previous years. Scabios is also plentiful; the white sells fairly for funeral work, but colors are not cared for. Gladiolus is very plentiful, but does not sell extra well; in a good many cases the flowers are rather small. Sweet peas are dropping out, and carnations are poor. Smilax is not very plentiful.

PANSIES.

THE BEST ARE THE CHEAPEST.

SIZE is a strong point in Pansies; when you combine size, color, substance and form they are pretty near right. By careful hybridization and selection I have accomplished this, and the Pansies I send out this Fall will be an agreeable surprise, even to former customers. If you buy Pansies I would be pleased to correspond with you; they will be offered for sale from Aug. 20th to Dec. 1st, at 75c. per 100 or \$5 per 1000. Terms cash with order or C. O. D. No seed for sale.

Toronto.

Everybody is praising the convention number and Columbian souvenir of the AMERICAN FLORIST. It certainly must be acknowledged that it beats the record in the line of horticultural newspapers.

The Toronto Gardeners' and Florists' Association had its first annual picnic on Wednesday. The members, their wives and children, their sweethearts, brothers, sisters, cousins, aunts, etc., turned out in great force, all bound to have a good time. The sky was cloudless and the place selected all that could be desired—shady and secluded. The cricket match between the east and west sides was the first event. The ground was not exactly as level as a billiard table and the batters were a little uncertain whether the ball would light on their pet corns or on their heads, but the result of the match was rather a surprise and a source of not a little pride to the winners. The east end eleven contained four or five members of a crack cricket club who do a lot of practicing and it was almost a foregone conclusion that the west end would be snowed under, but owing to careful play, hard hitting and lots of good luck the west end managed to come in at the finish two runs ahead—37 to 35—the east enders coming in for lots of chaff.

The tug of war also between the east and west created lots of fun and excitement, and in this event the west (it is said with the assistance of the ladies) redeemed their honor and managed to pull the east end over the mark twice out of three times. Children's races, ladies' races, fat men's races, thin men's races, bald headed men's races and three legged races were also participated in until dinner was called, when all sat down with keen appetites and polished off all the good things the committee had provided. Those who could fling the light fantastic toe then adjourned to the verandah of a large old fashioned house near by and danced till dark, when all returned home well satisfied with the first attempt of the association in this line of amusement.

Sir D. S. Macpherson has presented his large collection of palms, cycads and greenhouse plants to the Horticultural Gardens on certain conditions. Needless to say that the gift will be accepted and conditions complied with. With the present mayor and most of the aldermen horticulture is quite a minor consideration in municipal matters, but it is sincerely to be hoped that John Chambers will be able to drive into their thick skulls the value of the gift and make them provide a decent place to put it in. If John cannot do it they are past redemption indeed.

To introduce our specialties we make this special offer of

1 STOTT DISTRIBUTER.

1 STOTT SPRAYER (The best made.)

20 lbs. KILLMRIGHT (Non-poisonous, but
Death to Insects.)

— FOR \$10 CASH. —

Will clean your Greenhouses and out-door plants of Aphids, Mealy Bug, Caterpillar and other insects. Order through your seedsman, or direct of

ENDORSED BY LEADING FLORISTS
EVERYWHERE.

WITH PROPER USE, SATISFACTION
GUARANTEED.

TO STOTT GARDEN IMPT CO., 136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed,

BOLANZ BROS., Akron, O.

Baltimore.

The fact of the matter is the florist who has not set his face westward is about as hot and uncomfortable as possible, and he has the further discomfort of knowing that his stay at home is for nothing. The weather is too hot and dry for weeds or flowers either to grow out of doors without plentiful watering, and, between a tight money market and the absence of most of his customers at summer resorts, he is without store business. But florists are an uncomplaining lot generally, and Baltimore florists, though great in many ways, are least in this. You can't get a really serious howl out of them, even with all the present drawbacks.

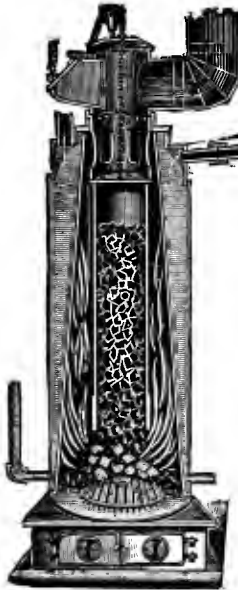

Prices are without change. Sweet peas have disappeared, but asters are plentiful. Roses continue in fair supply and some surprisingly good buds are to be had for the season, the product of Baltimore County, too. Smilax is to be had in any quantity at \$15 to \$20, and common outside flowers can be had at almost any price.

MACK.

Do YOU WANT a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

THE CANNAS at the World's Fair are beginning to present a fine appearance now, and will soon make a gorgeous show. Among the deep colored varieties Alphonse Bouvier is very conspicuous for general excellence. The color is very rich, the flowers are carried well above the foliage and the habit seems all that could be desired. We shall treat of each of the varieties in detail in an early issue, and shall also soon publish engravings from photographs of several of the beds. The aquatics are beginning to bloom and attract much attention. The attendance at the Fair is improving steadily as the date for closing draws nearer and has exceeded 100,000 each day for the past two weeks.

THE CONVENTION, the Horticultural Congress and the World's Fair was a combination that made a lively two weeks for those who attempted to attend to all these attractions. And it made it lively too for those connected with this journal in the effort to properly report all that would be of interest to the florists of America. But we believe we made a fair attempt. Our report is practically completed in this issue.

Horticultural Congress Banquet.

Last Friday evening (August 18) the distinguished visitors in attendance at the World's Fair Horticultural Congress were given a reception and banquet at the Union League Club, by the Horticultural Society of Chicago. It was a brilliant company and it is probable that many years will elapse before such a large number of men whose names stand high on the roll of those who have done lasting service to the "Art that doth mend nature" can again be assembled together at one time. Covers were laid for 100 and every seat was occupied. The tables were elaborated decorated with flowers contributed by various members of the Florist Club and arranged by President P. J. Hauswirth, while in the corners of the room stood numerous handsome palms from Mr. J. T. Anthony's collection, and the huge mantel at one end of the hall was handsomely decorated with plants supplied by the same gentleman.

Among those present were Henri L. de Vilmorin, head of the firm of Vilmorin-Andrieux & Co., and an officer of the Legion of Honor, Paris, France; Prof. Dr. L. Wittmack, Professor of Botany at the University of Berlin, Germany, and editor of *Gartenflora*; M. Lemoine, superintendent of the parks of Paris, now in charge of the French horticultural exhibit at the World's Fair; E. H. Krelage, Haarlem, Holland; J. Pederson-Bjergaard, Copenhagen, Denmark; Hon. Thomas B. Bryan, Chicago, vice-president of the World's Congresses; W. Atlee Burpee, Philadelphia, president of the American Seed Trade Association; P. J. Berckmans, Augusta, Ga., president of the American Pomological Society; Robert Craig, Philadelphia, ex-president of the Society of American Florists, vice-president of the Pennsylvania Horticultural Society, president of the Florists' Club of Philadelphia, and superintendent of Pennsylvania's horticultural display at the World's Fair; R. H. Warder, son of the late John A. Warder, so well known to every lover of trees and plants; Henry Izawa, in charge of the horticultural exhibit of Japan at the World's Fair; S. Tomiyami, Kobe, Japan; H. Augustine, president of the Illinois State Horticultural Society, and ex-president of the American Association of Nurserymen; Prof. Wm. Trelease, Director of the Missouri Botanical Garden, St. Louis; Wm. R. Smith, president of the Society of American Florists, and superintendent of the U. S. Botanical Garden, Washington; J. M. Samuels, Chief of the Department of Horticulture at the World's Fair; John Thorpe, Chief of the Bureau of Floriculture at the World's Fair, and ex-president of the Society of American Florists; R. Ulrich, landscape architect at the World's Fair; C. L. Watrous, Des Moines, Ia., ex-president of the American Association of Nurserymen; T. T. Lyon, the eminent

horticulturist of Michigan; Prof. Lorado Taft, of the Michigan Agricultural College; Prof. L. H. Bailey, of Cornell University; Dr. F. M. Hexamer, editor of the *American Agriculturist*; E. G. Hill, Richmond, Ind., president of the American Carnation Society, and ex-president of the Society of American Florists; M. A. Hunt, Terre Haute, Ind., president of the American Rose Society, and treasurer of the Society of American Florists; W. H. Ragan, chief of the bureau of pomology of the World's Fair, and secretary of the Indiana State Horticultural Society; James Dean, Bay Ridge, N. Y., ex-president of the Society of American Florists, and superintendent of the New York state horticultural display at the World's Fair; W. K. Harris, Philadelphia, president of the American Chrysanthemum Society; Ludwig Schiller, superintendent of Germany's horticultural display at the World's Fair; Wm. McMillan, superintendent of the parks of Buffalo, N. Y.; Warren H. Manning, Reading, Mass.; J. C. Vaughan, Chicago, chairman of the Horticultural Congress, and retiring president of the American Seed Trade Association; J. T. Anthony, Chicago, president-elect of the Society of American Florists; F. R. Pierson, Tarrytown, N. Y.; J. A. Pettigrew, superintendent of Lincoln Park, Chicago; W. H. Chadwick, president of the Horticultural Society of Chicago; Robert Kitt, Philadelphia, vice-president of the Society of American Florists; F. W. Barteldes, Lawrence, Kans., ex-president of the American Seed Trade Association; A. L. Don, secretary of the American Seed Trade Association; W. C. Egan, secretary of the Horticultural Society of Chicago; P. J. Hauswirth, president of the Chicago Florist Club; and a host of others whom it would take columns of space to mention.

After a pleasant hour spent in making new and renewing old acquaintances and friendships in the reception room the company sat down to a banquet that sustained the fame of the Union League Club.

Upon the arrival of the coffee and cigars President Chadwick called the assemblage to order and on behalf of the Horticultural Society of Chicago welcomed the visitors in the following words:

PRESIDENT CHADWICK:—It is a great pleasure and privilege to greet you this evening with words of welcome. Some of you are old friends and acquaintances from near by; others come from the shores of the Atlantic or the more distant Pacific, but all, I am sure, join in extending a most hearty welcome to such of our guests as have crossed the oceans to survey the crowning creation of the nineteenth century, the World's Columbian Exposition, and to assist in the work of its auxiliary congress, where the record of the achievements and progress of man is being written in undying words. I

trust that the result of the various congresses will be a grand fruition, for certainly in the scope of its subjects and its world-wide participants it has never been equalled.

The abstract and the concrete thus go down to posterity hand in hand, and of these twins, the evolution of hand and brain of man, the age may be justly proud. You, our guests, who have traveled to our smoky city, should not forget that its offspring is yonder glorious white city which, like its parent, sits on the shore of a great inland sea, and both cities, mother and child, equally command your attention. A commercial town, with a merchant marine second in tonnage to no port in the world but London, with her hands, as you see, full of business, Chicago has for you, and each of you, her cordial salutations.

While I am an amateur in horticulture of some thirty years' standing, to ask me to speak on this subject before men so noted in its various branches would be like sending one for some useful tool and have him bring from some dark and dusty attic a rusty augur and proceed to bore you. Greater bore, we will say, than calibre. I will now introduce to you the man who brought the World's Fair to Chicago, and that man is Thomas B. Bryan.

MR. BRYAN:—*Mr. Chairman and Gentlemen:* I am delighted at having this opportunity of meeting you and am rejoiced to see so many nationalities represented here. I think that the most conspicuous advantage of the exposition is in this blending of people together from all parts of the world. We are provincial until we come in contact with our fellows from across the ocean. We have no knowledge or conception of the peculiarities and the distinctions that exist with all other people until we come into conference with them, and then our scope of vision is enlarged, our affections are intensified and we begin to realize that it is perhaps after all the blood of common ancestors that courses through our veins. Looking down this table in every direction I encounter men who are high up in the field of humanity, because after all horticulture is the God-given profession of our race. [Applause.] I love horticulture and therefore I love horticulturists. And for these gentlemen who have commenced with the grafting and gone up through all the intricacies of horticulture, how can I, who have done nothing in that field, be without bashfulness or diffidence? Why, I remember to have gone out some thirty odd years ago an ignoramus into the country, and I had a plain and prairie to cultivate, and I cultivated it with great insanity and with absolute stupidity and with entire failure [Applause.]; and I sent abroad over the ocean to that distinguished gentleman Loudon and I got his books and I quit being an ignoramus and I studied him. It opened up a delightful creation. And then I came over to our own country, and then I got Downing—bless his memory [Applause.]—and between them I learned a little something that was not buried in the dark set aside for the insane. Trees spring up. One of my friends, Sanders from Washington, came all the way from Philadelphia to see that insane young man, to watch and see what he was about. They had heard of his planting the largest trees planted in America, and they sent Mr. Sanders up to find out what there was in it, and he looked at me, not with disdain, not with contempt, but with overpowering sympathy and compassion. "Why," said Sanders, put-

ting his arms around my narrow shoulders, "My good friend, you are young, and I am proud of your ingenuity and skill and tact and the way you are planting, but those trees won't live!" And I drew a deep long sigh and said "God bless you; come out next fall." He came out the next fall to see, and the trees did live, and he came another year, and the trees did live, and that plain is now a forest, and you are all welcome to go and see it and rest under its shade, under the shade of the hickories that yield their hickory nuts and of the oaks that yield their acorns. And, gentlemen, that is the end of horticulture as far as I am concerned. I am still an ignoramus.

Now, I am asked to talk of the congresses. I can only talk a minute or two about them. I am glad you have come to talk. It is the men that constitute a congress. It is the professional men that come to these congresses and give such admirable papers as have characterized your sessions that constitute the merit and advantage and value of them. I have no doubt myself that the contributions to the world's congresses—I mean of learning, of profound erudition, and practical experience, from all parts of the world—will constitute the most lasting benefit from the World's Columbian Exposition.

You take the Exposition, or you take Jackson Park now clothed in all its magnificence, and where is the most lovely feature about it? I may again be called heterodox; I may not be orthodox, but to my untutored eye there is nothing more lovely in all Jackson Park than that wooded island. [Applause.] It is the very perfection of landscape gardening, and it sprung out of the brain of that brainiest of landscape gardeners, Olmsted.

But let us pause a moment and be not too hasty in calling Washington the most beautiful capital in the universe. As a beautiful gem in the unions of states here it is high and lovely to behold, but compared with the home of this gentleman to my right (M. Vilmorin) let Washington be exceedingly modest. [Applause.] Great in everything is Paris. Great in her monumental grandeur, great in her abundance of art, great in the brilliance of her courts, and now, in her republican administration; great in horticulture from one end to the other. Paris leads the march of all cities. [Applause.]

Referring again to the Exposition it is sad to think that we are going to lose it. In a few short weeks the process of demolition will commence. Those magnificent structures that have challenged the admiration of the world, and justly, are to yield to the hand of the ruthless destroyer. I lament it; you lament it. I cannot go through any one of those buildings and look at those towering features, those beautiful columns and the exquisite work everywhere but it seems to me a sacrilege that they must come down. My own favorite idea in the beginning was to buy a few acres, 50 or 100 acres, put up some permanent buildings (four or five or six) on our own ground, then rent several acres around it and put on those rented grounds the temporary structures to be swept away at the end of the fair, and to let those permanent buildings remain, survive the fair, in order that in future we might perpetuate its most beautiful features. I wish it had been done. It think it would have been best. But after all mine was the judgment of an old man who has a right to step down and leave such things in the hands of the younger generation, and they had their plan agreed to.

The last time I was in Europe I went to Corfu, and I thought that the most beautiful thing in Corfu was the horticulture. I thought that the most beautiful, the most attractive, the most intensely bewitching thing was the horticulture, the landscape gardening, and I am sure that you gentlemen begin to think, if you have not already appreciated the fact, that your profession is absolutely saturated with the beautiful. I wish to heavens that my line through life had been cast in your life, to live among flowers and, among fruits and among trees—God's most beautiful creations. To have that refined, loving and ennobling association it seems to me must be the most delightful thing in the world, and above all that it leads to perpetual peace, and that nothing but accord dwells within you.

THE PRESIDENT: Our distinguished friend dwelt on that little sore spot that remains in all of us, that the beautiful World's Fair buildings must come down, must go. It is like a little flower that you pick; it is matured, it dies, then the fragrance is gone. I now take great pleasure in introducing to you the toastmaster of the evening, our much esteemed friend, Gilbert L. Grant of the AMERICAN FLORIST. [Applause.]

MR. GRANT:—Gentlemen, I shall not take up your time by any extended preliminary remarks. America, as you all well know, is the prow of the vessel in horticulture as it is in other directions. But we get our inspiration and the foundation for our work from abroad. I have before me the names of the three great horticultural countries of Europe—England, France and Germany. And I am pleased to say, gentlemen, that we have with us here to-night representatives of two of them. I very much regret to say that a gentleman that we fully expected to have with us here to-night has been unexpectedly called home. I expected to hear from him regarding the horticulturists of England. I refer to Mr. George Nicholson, Curator of the Royal Botanic Gardens of Kew, and I very much regret that we cannot have him with us here to-night. We expected to very much enjoy his response to the toast which I intended to propose to the horticulturists of England. But, gentlemen, we do have with us representatives of the two other great horticultural countries of Europe from which we have drawn the foundation upon which we, in America, are building to-day. I now propose a toast to the horticulturists of France, and I will call upon a gentleman to respond to it whose name will not be unfamiliar to you, I can assure you. To France what do we not owe in a horticultural way? I call upon Mr. Henri L. de Vilmorin of Paris to respond to this toast which we propose, this hand of fraternity which we extend to-night to the horticulturists of France.

MR. VILMORIN:—*Mr. Chairman and Gentlemen:* I am very much moved by the toast which has been proposed to me. You make me feel in a very forcible way that if after the very able and exceedingly bright speeches you have just listened to I were to attempt anything in the way of rhetorical speaking I should fail signally. I think in consequence you will allow me to speak in the simplest and plainest way what I feel. What I feel is deep gratitude to the Horticultural Society of Chicago and all the guests present for the compliment they have paid me and my country in drinking to our health as they did. We representatives of Europe deserve no great credit for coming

J. T. ANTHONY, CHICAGO. PRESIDENT-ELECT OF THE SOCIETY OF AMERICAN FLORISTS

over to the World's Columbian Exposition and to Chicago. We had great inducements to come. And those inducements were, first—you will permit me to say "first" because it interests all the city and all the country—to see that wonderful exposition that is so large in its extent and so complete in the number of things that are represented there; no similar exposition has ever heretofore been seen in this or any other country, and it is not likely to ever be seen again in any part of the world. Besides we were interested in horticulture. Another inducement in coming to this glorious place where the horticulturists of all the sections of the United States were to come together. We knew that by the immensity of space in your country and the endless variety and the conditions of the soil and climate quite new experiences would be brought to our knowledge and would be useful instruction, and we knew besides that in all sections of the country the American horticulturists have been at work with that energy, pluck and perseverance which are characteristics of the nation, and we knew that there would be many useful lessons to learn, and I have no doubt that when these congresses are over we foreigners will go home thankful for all the benefits that we have received at the hands of the Americans.

THE TOAST-MASTER:—I will now pro-

pose a toast to our fellow workers in Germany. France, Germany and England have worked hand in hand to furnish us the foundation upon which we here will undoubtedly build the greatest superstructure that can possibly be raised. I propose this toast to the horticulturists of Germany, and call upon a man than whom I think there could be none better to respond, a gentleman who occupies the position of Professor of Botany as well as a Director of the University of Berlin, who is a director of the great Agricultural Experiment Station of Germany, and who is sent here by the German government to report on our great Columbian Exposition for the benefit of that nation, Professor Doctor L. Wittmack.

PROF. WITTMACK:—*Mr. Chairman and Gentlemen:* I am very much obliged to you for the toast which my friend, Mr. Grant, has proposed to the German horticulturists, but I must be modest. I must say that not Germany or France alone in Europe constitute horticulture. It is still Holland, which are our ancestors I may say, and which are the most eminent horticulturists in the whole European continent. But, notwithstanding, I speak with great thanks for the toast which has been offered to German horticulturists. I must say that I am quite struck by the kind reception we find

here in Chicago, found there in St. Louis at the convention of the Society of American Florists, and I beg to express here, what I could not do at St. Louis, my most hearty thanks for this kind reception, and I beg to offer them also to-night to the Horticultural Society of Chicago, who have so kindly received us to-night. It is a very difficult thing for a foreigner to conceive of what you have done, but I say that in the few weeks which I have remained here I have seen so much which is so striking, which is so admirable that it is of the greatest importance to speak of and to report to my countrymen. America is said to be a land of wonders with us. I must confess that when I came here and when I stood here I saw new manners. America is not the land of wonders. But it is the land of admiration. I see foreigners here everywhere. I see progress going ahead much faster here than it does in Europe, and it is just that, gentlemen, which will improve here the horticulture, and as yesterday I spoke of the gates which lead to heaven, now I will speak of the golden gates here which are open in America for us who come from abroad. The golden gates of the White City are open; they have shown us the entry to this cordial horticultural society. And to these cordial societies I should like to say, which have received us so well, let us hope that the horticulture of America may always increase in the same manner that it has done now.

THE TOAST-MASTER.—We have with us here to-night, gentlemen, a great many gentlemen who are connected with the traffic in an article of tremendous power. Possibly you may suspect dynamite, but you would be incorrect. I refer to something that has more power than any explosive material known to science. You may wonder at that. I refer to the power in the little acorn, from which springs the giant oak. I propose a toast to the American Seed Trade Association, and will call upon its president, Mr. W. Atlee Burpee of Philadelphia to respond.

MR. BURPEE:—This afternoon as I was returning from a hard day's work seeing the beautiful white city which you have prepared for your guests of all nations and every state I looked forward to this meeting to-night with a great deal of pleasure, to the social intercourse here this evening, with very much the feeling of the Englishman who for a few months had been doing all Europe. After doing all France he got to Germany with his courier. He arrived exhausted at a small German village. He was assigned a very good suite of rooms, reclined gratefully in an easy chair and said exhaustedly to his courier, "Well, what is to be seen here?" The courier replied, "Oh, there is nothing to be seen in this town." The Englishman answered, "Well, then, let us engage these rooms for a month." This expresses the feeling of restfulness with which I took the car from the World's Fair to come here to-night. But unfortunately my feeling of peace, the peace which Mr. Bryan has so beautifully expressed, was disturbed by taking up the evening paper and there seeing that to-night, after your worthy president, Mr. Bryan, Mr. Vilmorin and Dr. Wittmack, your toast-master, without any warning, without the slightest intimation, expected me to respond to a toast to the American Seed Trade Association. All I can do is to briefly allude to this American Seed Trade Association. Mr. J. C. Vaughan, of your society and of this city, has by his indomitable work during the past twelve months, by his constant oversight over the committee's business,

gathered together men to read papers on different subjects of interest, and has given to us members of the American Seed Trade Association from all the sections of this country and Canada, the most interesting and most instructive meeting that we have ever had. It occurred to me in the intervals between drinking and eating to ask Dr. Wittmack and Mr. Vilmorin whether there were in all Europe a similar association. I knew that there was none in England. Mr. Vilmorin assures me that there is none similar in France, and Mr. Wittmack says the same of Germany. Therefore the American Seed Trade Association, which was formed a little over ten years ago, is unique of its kind. It gathers together in one association and admits as eligible to membership every grower and dealer of seeds in America in the general line. During all the period of its existence I have never known it to refuse admission to any honorable candidate. Its doors are wide open. It welcomes the smaller as well as the larger dealer, and I will say, and I know that the members of this association who are here will agree with me, that the papers read and the subjects discussed are discussed with a freedom and with a candor which is at all times noticeable. I see on my left a gentleman from Denmark who a few days ago I had the pleasure of having to dine with me. The same day there were present three American seedsmen, all members of this association, but unfortunately not present at our meeting. After they had left and we had spent the day walking around town he said to me, "Why, Mr. Burpee, I am astonished that you all meet together in such perfect good fellowship and seem to be such warm personal friends. From way off in Denmark I have been reading your catalogues and I supposed that you were cutting each other's throats." [Laughter.] Now it is this very spirit of fellowship that this American Seed Trade Association has advanced. It is above all petty meanness. It is a great thing to recognize that any success must be born of knowledge, that our interests are not antagonistic, but are common. When we travel through Germany, through France or England, we come home impressed with the idea that horticulture in America is yet in its infancy only. We have traveled through many towns in America and we see villages that have scarcely a single flower garden. They have no choice vegetables, but more generally depend on the trucker, and that trucker even sometimes comes from the city to serve them. There is an effort to change this and we are working hand in hand to that end. I know that each individual is working for his own best good by working for the best good of horticulture. [Applause.] On behalf of the American Seed Trade Association, Mr. President, I can only extend my most hearty thanks and my appreciation for the courtesy which the Horticultural Society of Chicago has shown in this most enjoyable meeting.

THE TOAST-MASTER:—Some weeks ago at one of our Florist Club meetings we enjoyed a unique treat in the vocal line, and I propose if possible to favor this company with what we enjoyed at that time. Before I announce the singer I want to say that there is a country to which we owe a great deal for plants, rare plants, useful plants. I refer to Japan. I am glad to say that we have with us here to-night a representative of that country. We are a very cosmopolitan company, gentlemen. I will ask Mr. Henry Izawa to favor us with a Japanese

love song, such as he gave us at our last Florist Club supper. [Mr. Izawa responded with a song in Japanese which was received with prolonged applause.]

THE TOAST-MASTER:—Gentlemen, we commenced with the seed and will pass on to the work of the nurseryman. The nurseryman has been a missionary that has done a very great deal for horticulture all over the world. The value of that work can hardly be estimated. We have with us to-night a son of one of the oldest nurserymen in the country. I believe one of my very first recollections of names in horticulture was that of John A. Warder, and I am pleased to say, gentlemen, that we have with us here to-night his son, who is fully able to represent the father who went before him. I call upon Mr. R. H. Warder to respond on behalf of the nurserymen.

MR. WARDER:—*Mr. Chairman and Gentlemen:* On this occasion I am more than happy to be called upon and glad to meet these people of the different nations of the world. Among them are many of my father's old friends and they have taken me by the hand and introduced themselves. When I meet men like Mr. Smith, Bryan and Sanders and see others here whose names I have known, including our distinguished foreign guests, I am proud to be here on this occasion. Though why I should speak on this occasion without perhaps a copy of Loudon I hardly know. My earliest recollection is of raising trees and loving them. I have been a humble planter of trees rather than a grower, but I honor that trade which has done so much to facilitate the interchange of rare trees, flowers, plants, etc., from Japan, South America, Europe, Asia, Belgium, France and Germany, and in some of our small villages, in spite of what Mr. Burpee said, we find rare specimens and as devoted lovers of plants as can be found anywhere. I believe the love of plants is innate in the human heart. I am proud to be called upon, and proud to be the guest of the Horticultural Society. As we sometimes see the grandest effects accomplished on the ruins of a dead tree, the bush which preceded it, just so with these younger societies. We are proud of their impulse from our old society, which leads me to think may there not be a union in the future some time of all these associations. Why should they not have a common union, working together. In union there is strength. I offer this as a suggestion given to me by a friend, whose absence I regret extremely to-night, Mr. Garfield, of Michigan. Gentlemen, I now propose a toast, and I know that all the strangers present will join me, to the Horticultural Society of Chicago. I propose it standing. [All the visitors rose and responded heartily to the toast.]

THE TOAST-MASTER:—Gentlemen, we commenced with the seed and progressed to the plant. We will now proceed to the flower, not necessarily the crown of all; we will come to it a little later, but in a measure the crown to a very great many of us here to-night. A most important division, and one which I believe is growing in popular favor more rapidly than any other division is floriculture. I call upon Mr. Robert Craig, of the City of Brotherly Love, to respond to a toast to this beautiful division of horticulture.

MR. CRAIG:—*Mr. President and Gentlemen:* I feel somewhat as Mr. Burpee has expressed himself—the feeling of being hardly able on such short notice to adequately respond to the toast so kindly offered to floriculture, but I feel encouraged to say a few words because I am

sure of one thing—I am sure of sympathetic listeners. [Applause.] There is so much in common in a general way between the work and the development of the work in the lines of pomology, in the line of the improvement of vegetables, and of the line of the improvement of flowers that I feel we can sympathize with one another and can glory with one another as each branch advances. [Applause.] As you know the advance in the different lines of pomology is not rapid. Of the many seedling fruits that make their appearance from time to time it is only occasionally that one is found with points of excellence beyond others in its class. The advance is necessarily slow, but occasionally in pomology we are delighted with the appearance of the new fruit, which in point of size, color or flavor is recognized as an advance and acquisition. This is true also in the lines of vegetables. There are those here to-night who have watched the development of the vegetable from the comparatively insipid thing to the luscious and delightful thing that we enjoy to-day. The same is true in the line of flowers. Of the many novelties introduced each year we get but few that remain with us as a permanent advance. But in the midst of all the disappointments we do advance and we are advancing. And I may say that the florists' associations and the florists' clubs have by their organized efforts contributed greatly to the general advance. I might say that in the line of roses, the queen of flowers, we yearly make a slight advance. We get a better rose and a larger rose almost every year. One that stays with us and whose fragrance we inhale with continued delight. In the line of carnations I suppose the advance has been more remarkable than in any other line. This is largely due to the enthusiasm which has come out of the organization of the subdivision of the Society of American Florists known as the American Carnation Society. These gentlemen who make a specialty of cultivating that flower have been greatly stimulated by the exhibitions proposed and carried out by this young society. I was never more delighted in my life than with the exhibition of carnations at Pittsburg last year. I think every one who saw that exhibition is willing to admit that there had been a grand advance in the development of the divine flower. Carnations were shown I think at that meeting finer than ever before in the history of the world. They had it is true been prepared especially for that meeting. They had received special care looking forward to that exhibition. But I want to say that they never would have reached the extremely high development that those flowers showed if it had not been for the fact that this society was organized and that the members worked together with enthusiasm and harmony. [Applause.]

Gentlemen, I can not sit down without expressing my personal gratification at meeting with you here to-night. I have been at many gatherings of florists and have found them all congenial, but I find an added charm in this meeting here to-night in the presence of so many men who have distinguished themselves in other lines of horticulture. I am delighted especially to meet these gentlemen from abroad. I personally have had that pleasure seldom before, but I have in this visit to Chicago met gentlemen from France, from Germany and from Japan, and from other countries, and find them all congenial workers in the great cause that we all have so much at heart. I suppose in a meeting like this it is not

CONSERVATORIES AT HUMBOLDT PARK, CHICAGO.

necessary to say much specially about the uses and the advantages of flowers. That is conceded I am sure by every one present. They are welcome on every occasion, at the birth, at the marriage, and when the last sad rites are performed flowers are always appropriate and always welcome. So that I feel in a meeting like this that I need not say much in a general way on that aspect of the question.

In viewing in a general way the effect that flowers have on modern civilization I must confess that I am a little surprised at a certain great school of gardening known as the natural school of gardening who either ignore altogether or fail to adequately appreciate the advantage of color in the production of the landscape which it is their duty to create. I might say that I am entirely in harmony with that school of thought in much that they entail. I can join with them in the admiration of the different forms of shrubs and trees. I can admire the individual specimens of a graceful tree, and I am arrested by the verdure and the green. I enjoy the gently sloping bank of velvet green as it slides down to the water as much as anybody, but I want to ask those gentlemen here why it is that flowers are not more used and more advocated in their school? Is there anything more natural than the rhododendrons on the mountains in their blazes of color in the early June? Is there anything more natural than the feeling when you come close to flowers? I want to ask those gentlemen why it is that they do not ap-

preciate more than they do the use of flowers in their beautiful landscape effects.

THE TOAST-MASTER:—After the flower comes the fruit, and I am pleased to say that we have with us to-night the president of the American Pomological Society, a society that has done a vast amount of good for horticulture in this country. I will call upon Mr. P. J. Berckmans, of Augusta, Ga.

MR. BERCKMANS:—*Mr. President and Gentlemen:* It is useless for me to say many words in regard to American pomology and its wonderful development. We have it on record that even that little ship that we find now anchored in the lagoon brought back to Europe, long before Christopher Columbus made his discovery, the evidence that there was a country here worthy of being called Vineland. That was the first notice that the world had that you had a pomological problem. I recollect when I came to this great country and made the acquaintance of your illustrious pomologists, and I can remember well the words of welcome and friendship I received. I was surprised at the very small amount of fruit produced then in your country. In New York the only grape known then was the Isabella. The other day passing up the Hudson river I was pointed out the place where this grand production of pomology had its origin, you might say development. What have we to-day in comparison with this Isabella, which was the only representative of that great product forty years ago. In the way of pears the products are very limited. The organization

of the American Pomological Society had for its object the development of pomological education, and all honor is due to the man who originated that society, and I am proud to say that among the original promoters of that society was my friend, Mr. Campbell, who is here to-night, and to whom you owe that excellent product and standard of excellence the Delaware grape. Strawberries forty years ago in the New York markets and others, as you may well recollect, some of you who are a little older than I am, were sold in little basket at about six pence apiece, and I suppose the whole product then disposed of in the New York market in a week would not compare with what you now dispose of in the Chicago market in an hour. And it is the same with other products. You in Chicago to-day, gentlemen, have products on your markets that a few years ago were not thought of. Much to my astonishment I found that the California products are sold in Chicago at the same price that they are in the New York market or the Philadelphia market or any other market. That is by concentrated action. I came here to meet many old friends. I shall go home having made many firm and long lasting friendships. Such a reunion as we have had to-day is to be one of the most pleasant occasions in my life, and I thank you for this opportunity of having met so many of you and I hope that our friendship, which has been cemented, will be everlasting.

Upon request of the toast-master, Mr.

Robert Craig sang "Annie Laurie" in his usual happy way, the entire company joining in the chorus.

Mr. Robert Kift then gave an illustration of the production of a new plant. Mr. Kift is a prestidigitator of ability and with a pot of soil and a paper cone soon brought forth a plant of hardy phlox that rivalled the best catalogue pictures in dwarfness and generosity in bloom. This feat was greeted with prolonged applause.

Mr. Hugh M. Hughes favored the company with the song "Rocked in the cradle of the deep," and after a general handshaking the company dispersed.

The Present of Floriculture.

BY ROBERT CRAIG, PHILADELPHIA.

[Read before the Florists' session of the Horticultural Congress at Chicago, August 17.]

I assume, that under the term "Floriculture," may be considered ornamental horticulture in all its branches, including the adornment of parks, public gardens and home grounds, as well as interior decorations with flowering and foliage plants, and the use of cut flowers in the various ways that custom and individual taste may suggest, as well as methods of culture. It would be obviously improper in the short time allotted to attempt to go into details of the various branches; I can only take a hasty glance at the important features, and what appears to be the prevailing tendencies of the times. My limited personal knowledge is confined to this country, but in the discussion which may follow we can look for wider information from the distinguished foreigners present; of one thing we can rest assured, as long as the love of the beautiful inheres in man floriculture shall not lack ardent supporters.

We are all interested in the floral adornment of parks and public grounds, they are the great educators of the people; but still more important is it that our home surroundings be made attractive. The greatest of all human institutions, the world over, is the home; around it cluster all the fondest memories and associations. The tasteful use of flowers and shrubs will enhance its beauty, and their care and culture afford restful and healthful enjoyment. In the great rush of American life the garden offers rest. As our yet new country is gradually developing there is a constantly growing appreciation of its great value as a retreat for over-worked men and women from the cares of our too active life. Much has lately been written, and well written, in the leading horticultural journals, of the adornment of the spacious grounds surrounding the homes of the wealthy, but not enough in the way of suggestions as to the tasteful planting and correct culture of the smaller gardens of those not so endowed with worldly possessions; there is not room in these little spots for extensive landscape effects; they must be adorned in a more or less formal way, but such arrangement need not violate any principle of true art.

While considering this matter of outdoor gardening, I would call attention to the fact that there are several schools of gardening, one of them is known as the "natural" school, its aim being to take nature for a teacher and to produce effects somewhat in the similitude of nature's own handiwork, and to conserve such elements of beauty as may exist before the energies and art of man are brought to bear. But it must be remembered that nature is not always beautiful; she produces the poisonous and thorny weed and the noxious and tangled swamps as

well as vegetation pleasing to the senses.

The work of the landscape gardener is often to keep her in subjection, and not to blindly follow her. No garden can be altogether natural, and none altogether artificial. The so-called natural school is now largely represented in the horticultural literature of the times. It is to be deplored in these writings that there is a failure to recognize the importance of a judicious use of color in enhancing landscape effects, which may be done by the proper use of such shrubs and trees as the purple beech, golden sambucus, Cornus Spaethii, Acer Negundo variegata and the like, and by the use of masses of brilliant color, as is produced, for instance, by clumps of Asclepias tuberosa and similar flowering plants; and where brilliant effects are desired I can see no reasonable objection to the use of geraniums, cannas, etc. I know it is objected by some of the radicals of the naturalistic school that these plants by their continued bloom may be monotonous, but does not a landscape always green become monotonous? I know that the love of color is almost universal, and it is right that this feeling should be ministered unto. I do not object to green as the prevailing color, but is there not danger of a feeling of monotony when all bloom and bright foliage is conspicuously absent?

Besides the natural style of landscape gardening there is another known as the architectural or formal; the latter recognizes that there exists in the minds of many a love of symmetry and regularity and the outcome is the production of formal beds in various attractive patterns, which, when the work is skillfully done, are much admired. The proper position for such beds is where they will be in harmony with the architecture of the neighborhood, or where they may form part of a design including other beds, the whole being laid out on consistent geometrical lines. The weakness of the so-called "natural" school is that it almost or altogether ignores the importance of this branch of gardening. Fortunately there is another school of gardening known as the composite, which is willing to recognize merit in both of the other schools, and whose present problem is to decide on the proper location and relations of illustrations of both methods, cheerfully recognizing that each is right in its own place. No less an authority than the distinguished French landscape gardener, Andre, has recently said: "To the composite style, which results from a mingling of the other two, under favorable conditions, belongs the future of gardening art."

It is very gratifying that in this present time, more than ever before, there is a disposition on the part of our leading architects to recognize the importance of landscape gardening; it is now considered necessary to call in the landscape gardener for consultation when a new place is to be created. And wonderful advances have already been made by this disposition of the architect and landscape gardener to work together in harmony. What sad failures have resulted when the architect, no matter how eminent in his own profession, has alone designed the houses intended for plant culture. It can not be expected that he can understand the requirements of plant life, hence the necessity of consulting one who has made these things a life study. Some of the most gratifying exhibits at the World's Fair are the greenhouses and conservatories, which is the result of conferences between the best cultivators of plants and the greatest architects, the outcome

being that the structures are beautiful from an architectural standpoint, and eminently adapted to the purpose required.

Another hopeful sign of the times is the interest taken in improved varieties of outdoor bedding plants, such as roses, geraniums, carnations, verbenas, etc. This is notable in the case of the dwarf large flowering cannas of the Crozy type. These latter are destined to play a great part in the future of American gardening; they not only produce a continuation of brilliant bloom, but are also graceful in foliage and growth. Although to M. Crozy, of France, belongs the credit of discovering their susceptibility to improvement, and of introducing many superb sorts, it has recently been found that the American climate is admirably adapted to the production of seed and development of seedlings, and a few excellent ones have already appeared.

This canna is a grand plant and its improvement is yet in its infancy. Like the chrysanthemum it is destined to grow in popularity. There is also remarkable interest taken at the present time in the introduction and cultivation of hardy perennial plants; they are deservedly popular, having the advantage of permanency, and if a proper selection be made keep up a continued bloom from early spring until frost comes in the fall. While outdoor gardening is receiving due attention there was never a time when plants under glass and flowers for cutting were grown in such perfection, the improved greenhouses of to-day contributing greatly to the result. The growing interest in aquatic plants is especially noticeable; their cultivation is yearly better understood, and many kinds are now successfully grown in the open air which a few years ago were not considered.

The amateur horticultural press and the trade journals are active and efficient in advancing horticulture, and daily papers and magazines cheerfully publish all matters of interest which they can procure, which are eagerly read by many. The modern trade catalogue must not be forgotten among the agencies which advance horticulture. They are educational in a high degree, and their illustrations are faithful to nature more than at any previous time.

It is to be hoped that botanical gardens will soon be established in several large cities; the plans and money for the proposed one in New York are nearly ready; this is to be somewhat on the plan of the famous Kew Garden at London, England. Who can fully appreciate the work that has been carried on at this institution in the past fifty years? Hundreds of young men have gone from there to all parts of the world well equipped in knowledge and full of enthusiasm begotten of contact with minds developed by the methods and association of that institution. On the whole the outlook is very encouraging; it is only necessary for each of us, while being diligent in our own business, to make some personal sacrifice for the public good, and to help by our sympathy and work all societies, clubs and managers of public exhibitions in every reasonable way.

Dwarfing Plants In Japan.

In his paper read before the Horticultural Congress at Chicago Mr. H. Izawa described the methods employed by Japanese gardeners to produce the dwarfed plants of which specimens are shown in

FANCY BEDDING IN GARFIELD PARK, CHICAGO.

the miniature Japanese garden at the World's Fair. He said:

"The pines may be considered the most important of all trees in Japan, and great care is taken in their cultivation and preservation. The most popular ones are *Pinus densiflora*, *Pinus parviflora* and *Pinus Thunbergii*. They are generally grown from seed, and great care is taken to select the choicest quality of seed. In the spring of the second year, when the seedlings are about eight inches in height, they are staked with bamboo canes and tied with rice straw, the plants being bent in different desirable shapes. In the next fall they are transplanted to a richer soil and well fertilized. In the following spring the plants are restaked and twisted and tied in fanciful forms. This mode of treatment is given until the seventh year, when the trees will have assumed fairly large proportions, the branches being trained in graceful forms, and the foliage, like small clouds of dense green. The plants are now taken up and potted in pots eighteen inches in diameter and are kept well watered. Every succeeding year great care is taken of new shoots, which must be kept pinched back. After another three years of this treatment the trees are virtually dwarfed, there being no visible growth thereafter.

"The dwarfing of the bamboo is another important branch of the Japanese nursery business. Three weeks after bamboo shoots begin to grow, and when the trunks measure about eight inches in circumference and five feet in height, the bark is removed piece by piece from the joint. After five weeks, when the plant gets somewhat stout, we bend and tie the stem zigzag. After three months,

when the side shoots grow strong enough, we cut them all off five or six inches from the main trunk; they are then dug up and potted in sand. Care is taken not to use any fertilizer, but plenty of water is given. The large shoots are cut off every year, in May or June, and after three years the twigs and leaves present admirable yellow and green tints.

"Thuyas are dwarfed by means of grafting. A *Thuja Lobbi* seedling is grown in fertile soil for three years, or until it becomes about five feet in height, then, in the middle of spring, all branches are cut off, leaving the trunk and top branch. Then with a $\frac{1}{4}$ -inch chisel holes an inch deep are hollowed out every two or three inches in the thickest portion of the trunk, so that the trunk can be bent more easily in the desired direction. Rice straw is twisted around the trunk, which is bent in many curious forms and fanciful shapes. In springtime of the second year of this treatment the plants are potted in rich soil. In another two years, when the plants have assumed permanent forms, *Thuja obtusa* is grafted on the *Lobbi* stem.

"The process of grafting is in brief as follows: Apply plenty of fertilizer to the *Thuja Lobbi* plant; in early spring take some 2-inch shoots of *Thuja obtusa*, cut the end in a slanting plane and insert on the smaller portions of the *Thuja Lobbi* trunk, one graft to every inch on the trunk; wrap the grafts with rice straw and take the plants to a shady windless room with a temperature of 35° F.; increase the temperature 1° or 2° daily, and continue this for three weeks. By this time a little breeze may be admitted, and leave the temperature of the room at 60°

for two weeks and at 70° for two weeks; leaves will soon grow from the grafted twigs. In the latter part of spring, when the temperature in and out of doors becomes uniform, the plants can be safely transferred to some shady position out of doors. In the fall, when all the grafts have taken good hold, cut off all the remaining shoots of *Thuja Lobbi*; transplant every year in good rich soil. Six years will be sufficient to produce handsome specimens of dwarfed thuyas. All kinds of conifers are treated in a similar manner. There is, also, a great demand for curiosities in mixed grafted conifers, that is, six or seven kinds of conifers on one plant.

"Maples form one of the best materials for the artistic fancies of the Japanese craftsman. Many times a great many different varieties of maples are grafted on one stem. Seedling maples are spliced and tied together when growing. After they have formed a union the desired shoot is cut off; this is kept up until ten or twenty varieties are obtained. Maples thus grafted form lovely features for lawns, their varying hues and types of foliage enhancing each other's beauty.

"Now, a few words regarding our miniature gardening. The æsthetic idea shows itself in every line of Japanese industries, and especially is it the case with our nurserymen and landscape gardeners. The most inexperienced need not fear any difficulty in our mode of gardening if he but uses his mind and efforts in the right direction. The skillful artist introduces into his miniature garden, not regular geometrical forms, but anything odd, irregular and artistic. To us gardening is not mathematic, but an art, hills, dales

rivulets, waterfalls, bridges, etc., vie with each other in presenting their quaintest forms and fancies and harmonious symmetry. Dwarfed plants of all descriptions deck the scene here and therein thousands of peculiarly artistic shapes. We derive many lessons from nature, and strive to imitate her as much as is practicable, although on a smaller scale. It is in the person of a Japanese gardener that Dame Nature finds her most ardent lover; his is the ambition to make his country a place for men like Arnold to flee to when seeking a studio to the beauties of the "Light of the World."

Seasonable Hints.

The first report of the American Carnation Society gives a list of 420 varieties of carnations, which includes nearly all to date, but a few of the number are synonyms. The great majority, however, are new to the trade, and consequently untried. Over one-fourth have been introduced during or since 1890, and have not yet become widely disseminated. These latter comprise many well worth a fair trial, of which we will mention the following that would seem to deserve extended propagation and use: Christmas, Constancy, Crimson Coronet, Daybreak, Edelweiss, Edna Craig, Fred Creighton, Fred Dorner, Grace Battles, Grace Darling, J. R. Freeman, Lizzie McGowan, Mrs. Fisher, Puritan, Thos. Cartledge, Wm. F. Dreer and Mme. Diaz Albertini. To this list may be added the following older varieties: Alegatiere, Anna Webb, Buttercup, Century, Chester Pride, Crimson King, Dawn, Duke of Orange, Edwardsii or Peerless, E. G. Hill, Ferdinand Mangold, Golden Gate, Golden Triumph, Grace Fardon, Grace Wilder, Hector, Hinsdale, Hinz's White, Jeanette, J. J. Harrison, La Purite, L. L. Lamborn, Snowdon, Portia, Garfield or Robt. Craig, Orient, Philadelphia Red, Silver Spray, Sunrise, Tidal Wave, Var. La Purite, Wanda and Wm. Swayne.

This list of fifty we think will include all those generally grown, and from which nine-tenths of the flowers are produced. A few others may have a local fame of which we are not aware. A few mentioned above are old varieties once largely grown, now generally discarded, viz.: Crimson King, Duke of Orange, Edwardsii, Grace Fardon, La Purite, Snowdon, Orient and Philadelphia Red. Many of the most recent introductions are very promising, and will no doubt take their places as standards. The above list we hope will simplify matters for the novice somewhat. But one must recollect he must choose such kinds as are suitable to his particular soil and surroundings. No carnation above mentioned can be grown universally. Daybreak, Grace Wilder, Portia, Tidal Wave and Silver Spray come nearer filling the bill in that particular than any we can mention, but even these will fail in some localities. The only directions we can give is to try the most likely sorts and hold on to those that do well. Do not invest too largely in novelties, but give the newer kinds a trial in a small way, when, if found to be suitable, they can be grown in quantity. In growing carnations for flowers but

few kinds are needed, representing the different colors. The selection of the proper kinds is a matter almost entirely of experience.

W. R. SHELMIER.

Avondale, Pa.

Miscellaneous Seasonable Hints.

Get your pots and soil ready to lift from the bench the chrysanthemums which you want for pot plants. The first week in September is the time. Then you have time to clear out the soil, overhaul the benches, and get in soil for carnations, which you will plant from the 15th to the 30th of September. Let the chrysanthemums be a little longer than usual without a watering and then water a few hours only before lifting. Get your fork well under and they will lift without losing a fibre and grow right along without a leaf turning yellow. Keep them well watered and syringed overhead three or four times a day for the first week, after which time they will be sufficiently well rooted in the pots to have plenty of light and air. But don't put them out of doors at any time. They will nearly double in size after being lifted and potted, and will well fill the pots with roots, so a little bone meal mixed with the potting soil is necessary to carry them through the flowering time if the best results are looked for. Just as soon as convenient put one strong stake in the center of these plants and support each branch with fine smilax twine to the centre; that's enough to hold them together and they won't have that wretched staked appearance that you see on some so called specimen plants; neither will they look like a cos lettuce tied up to bleach, which is liable to be the case when one string surrounds the whole bush.

About September 1st sow another lot of cineraria, primula and calceolaria. As all these thrive in a cool temperature it is much easier to grow the second lot (which should be managed to come in at Easter) than it is to summer the May and June sown crop. If the come up is good don't be afraid to throw away 75 per cent. of them. The call is limited for such plants and they want lots of room (cineraria and calceolaria especially) to grow them well. It is no earthly use to grow them at all unless you can give them sufficient room to amply develop their leaves, so grow only what you can afford to treat properly.

Begonia semperflorens gigantea, a fine house plant for midwinter, should have its top pinched out now and shifted into its flowering pot, a 5 to 6-inch; besides being a fine pot plant, the large scarlet flowers of this beautiful begonia are very useful at times.

It is not yet too late to sow hollyhocks for next summer's flowers. There is an increasing demand for these every year and I have found good strong young plants very difficult to procure. Sow the best strain you can buy, and when large enough pot into 2-inch pots and grow them along outdoors till November 1st, then shift into 3-inch, or better into 4-inch pots if you can afford the room. The best I ever grew were wintered in a very cool house, but a well protected cold frame will do for them. Plant out in spring as soon as soil is dug and dry enough and you will be well rewarded for the little trouble over them. There is nothing like experience, so I beg to give mine, and that is that the best hollyhocks I ever grew, which were eight feet high, well branched, with hundreds of flowers on every plant, were planted in a stiff

brick clay with plenty of good manure added to it.

Delphinium formosum, Coreopsis lanceolata, and other useful perennials, can now be sown, and may be wintered in a cold frame. They will be very useful to all those who have land enough for them.

It is a good time now to root a few hundred of the double sweet alyssum for winter bloom. Take of course only the young tender shoots. Some find this little flower so useful for design work that I see it grown on benches, but if you don't want that amount, a few dozen plants along the edge of your carnation bed is indispensable to the retail florist and is clear profit.

Don't neglect to train up your young shoots of smilax and asparagus every few days, and when they are a little longer they won't depart from the string.

Buffalo, August 21. Wm. Scott.

Philadelphia.

Trade light !!!

The trade is no lighter this August than any other August, so far as I have been able to find out. The depression in trade generally, which has swept o'er the length and breadth of the country with unmistakable effect has not had anything to do with the florists' business during July and August excepting as regards collections, and our business has suffered in that respect equally with most others. Florists as a rule are neither pessimists nor are they optimists, but generally speaking they all have an eye on the main chance, and many of them "get there" at least with one foot and some of them with both feet. It is idle to attempt to predict what will be the probable outcome during the coming season. All that can be done at present is to hope for the best, and prepare for the worst.

Mr. H. H. Battles has returned from his four weeks vacation in the New Hampshire hills very much improved in appearance and health. He looks as though he would be well able to take good care of the business which he feels entitled to, and expects to secure during the season to come. Mr. Battles is not a pessimist.

Mr. Thomas Cartledge—the old reliable—with his daughter is about to start—if he has not already gone—to the World's Fair. Thomas is fully entitled to his vacation, and every body wishes him a good time and a safe return.

Mr. George Craig has returned from the World's Fair and St. Louis. In George's undemonstrative way he speaks very highly of what he saw at the white city. He takes the defeat of the Philadelphia bowling team very philosophically.

At the regular stated meeting of the Pennsylvania Horticultural Society, which was held last Tuesday in St. George Hall, southwest corner of Arch and Thirteenth streets, in the absence of the president and vice-presidents, Edwin Lonsdale was, on motion of D. Bearn, called upon to occupy the chair.

Secretary Farson reported, on behalf of the committee on arrangements, that he had visited and examined all the available and promising halls in the city with a view to the selection of one in which to hold the next fall exhibition and chrysanthemum show, and in his judgment considered that the Armory Drill Hall and parlors (I forget the name of the regiment to which it belongs) on Broad street, not so far north of the Public Buildings as the ruined Horticultural Hall is south of that pile. So that it is in a very desirable neighborhood, quite convenient to either Broad Street Station

A TASTEFULLY ARRANGED SMALL GROUP OF DECORATIVE PLANTS.

(Pennsylvania R. R.) or Market Street Station (Philadelphia & Reading R. R.) The patrons and members cannot complain of the location; nor can they find any fault with the hall. Excepting that there is no lower hall, and the foyer is lacking, the dimensions of the main hall are very little short of being what old Horticultural Hall is, or rather was.

What bothers the committee of arrangements now is the time for keeping the show open. For some few years back it has been thought advisable to keep open the show for two weeks instead of one, and last fall the committee on revision of schedule made the necessary provisions in the list of prizes and offering of premiums to allow for two weeks' continuance, but now it is somewhat doubtful since the old hall has been burned down whether this arrangement can be carried out, as it would put the regiment to much more inconvenience to allow their hall to be in the hands of the horticulturists for more than one week. One of the troubles seems to be that under the enlarged schedule all the competing exhibits could not find adequate space in the hall selected if the time of the exhibition is to be reduced to one week.

It is deemed advisable and necessary to call the committee on the revision of the schedule together for the purpose of cutting the offers of premiums down so as to

make the exhibits in accordance with the space at command and the time to one week. Some of the committee are anxious lest exhibitors may object to the change, but no reasonable man can object, because it is not the fault of the society that it is necessary to make some changes in the schedule and the length of time to hold the show open.

The adjustment of the damages to Horticultural Hall still hangs fire. It seems from what can be learned that the two appraisers—one selected by the insurance company and the other by the trustees of Horticultural Hall—could not, or would not, agree upon a third appraiser. Superintendent Farson, it is stated, has now assumed control, and we may now reasonably hope that a speedy termination of the matter will be effected which will, we trust, be fair and equitable to all the parties concerned.

Fire insurance agents have a choice stock of expressions which they make the most effective use of when soliciting trade, but, judging from the experience of the trustees of Horticultural Hall and some others who have met with misfortune by fire, it would almost seem as if it would be the most satisfactory to insure ourselves.

The report of the special committee on library at the aforesaid meeting of the Pennsylvania Horticultural Society

stated that over \$1,100 had been collected, over \$600 had been spent and that over \$400 was still in hand.

At the first blush after it is mentioned that Atlantic City, N. J., had been selected as the next place of meeting for the convention of the S. A. F., it does not seem to be quite the place, but the more apparent it becomes that very few places in the country offer the same inducements. Some good judgment is necessary in the selection of the time of sessions so as to give the members a free foot during the regulation bathing hours. Florists, as a rule, are early risers, so that there is no reason at all why sessions should not commence as early as eight or not later than nine o'clock in the morning. This would be one way to take time by the forelock and it would leave little or no excuse for the members to go away before the first business of the day was transacted. Atlantic City is inclined to be gay in the evening, so that perhaps it will be best to do away with the evening session and have a session in the afternoon. All these matters will bear very careful consideration at the hands of the executive committee at its next annual meeting, which, according to usage, is held in the winter season in the city which has been selected for the next convention. The opera house at Atlantic City, which everybody who was interested in the movement to bring the next convention to the city by the sea, had his eye upon in which to hold all the business sessions, unfortunately was burned to the ground a day or two ago. Whether it will be rebuilt in time for next August is doubtful, as it is stated that the building had not been a very profitable investment to the owners. However, other places may be found in good time, it is to be hoped, which may answer the purpose quite as well. At the next meeting of the Florists' Club of Philadelphia I suppose committees will be appointed to look after the different interests of the next convention.

It has been stated since Atlantic City has been selected that the florists of New Jersey had contemplated inviting the S. A. F. to that point to hold its regular convention. If that be so it is unfortunate that Philadelphia should have stolen this march upon their brethren in New Jersey. One thing is certain, the Philadelphia boys were not aware that such a project was in contemplation, or I am sure the action taken would not have been attempted.

The La Roche & Stahl failure is still fruitful of much comment. Many of the florists have not yet signed the agreement, though most of them seem inclined to do so. Some have not yet returned from the World's Fair. Nothing definite can be known until they have all returned, notwithstanding that it has been asserted in some quarters that everything had been arranged for the firm to continue in business at the old stands. It is a bad failure. There is no doubt that it was the real estate transactions which swamped them, and it will take a healthy boom in real estate in the neighborhood of Collingdale to lift them out of their present difficulties, and it is to be hoped that success will crown their laudable efforts to pay every dollar they owe with interest.

Only one of the team of bowlers from this city, who took part in the tournament at St. Louis, has so far been seen. Whether they have deferred their return until the matter has blown over or not I have no means of knowing. Certain it is that none of them have been seen in their

old haunts up to this time. The least said about the matter the better.

It was a sad termination to the trip of Mr. and Mrs. Burton, who had gone to St. Louis and who expected to spend some time at the World's Fair. The cause of their suddenly being called home was a serious accident which happened to Mrs. Burton's mother, Mrs. Lees. A turn or the better has now set in and it is to be hoped that she will soon be well and strong again.

The weather hereabouts is unusually dry, no rain of any consequence has fallen for several weeks. Everything outdoors is suffering in consequence, and carnations and many other things useful to florists will be much smaller than usual at lifting time, next fall. This at least cannot be blamed upon the new administration. L.

Boston.

The excursionists to St. Louis and Chicago have been returning one by one or in small groups, and all with the same story to tell, of a thoroughly enjoyable time. All claim to have had the best trip on record, and they chuckle audibly as they hear the story of scorching days which the stay-at-homes had to endure in the meantime.

Local trade continues dull. Gladioluses, asters and garden flowers in general are very abundant. The wholesale dealers have begun to feel quite a pressure from the seaside, Bar Harbor especially having made some pretty heavy demands on their resources during the past week.

The free Saturday exhibitions at Horticultural Hall are now at their height, and from 12 till 3 o'clock the hall is crowded. Gladioluses, dahlias, asters, tuberous begonias and hardy perennials in great variety constitute the great part of the shows at present.

Much pleasure and satisfaction is expressed here over the news that Hon. C. W. Hoitt, of Nashua, N. H., has been nominated as World's Fair commissioner in place of Geo. F. Page, of Concord, resigned. Judge Hoitt is one of the boys and is very popular wherever known.

The announcement that Elijah A. Wood, of West Newton, had been elected president of the American Chrysanthemum Society was also received with much favor. "Little Woodie" is another one of the boys.

Mr. Alexander Montgomery arrived home but three hours before the time set for his mother's funeral. A more sudden and terrible affliction could scarcely befall any one, and much sympathy is expressed on all sides.

Buffalo.

There is no break in our long continued drought, the longest and most severe the writer can remember in this or any other country. The dust has been laid twice in about twelve weeks. The grass is dried up and the "poor" grasshoppers have to come to town to get something green to nibble at, and the popular question just now, when you meet a friend, regardless of his or her profession, is "How are the grasshoppers with you." They have done much harm in the greenhouses and some of the florists have been so troubled with their visits they have found it necessary to cover ventilating space with muslin. This protracted dry spell has made all kinds of flowers scarce especially where the hose could not reach them.

Business is very erratic; one day it is with you and the next it is not and more

often it is the latter. I have never seen white carnations so scarce, and sweet peas will soon be gone. The advent of good roses will soon come and welcome they will be. The strong smelling Lilium auratum is with us in abundance and they are all used up.

Mr. J. F. Cowell is busy looking up exhibitors and exhibits for the big interstate fair at Elmira next week, of the horticultural department of which he has charge.

Buffalo's representation at St. Louis was awfully small but very select, what there was of it. All the boys seem to have some good excuse for non-attendance. The FLORIST has been looked for all the more eagerly to see all the happenings. And they all seem to have had a good time as well as an instructive one. All we absentees can console ourselves with is that Atlantic City is to come.

I regret to have to announce the death of Mrs. George Troup, wife of the superintendent of our beautiful Forest Lawn Cemetery. The occurrence is lamentable. Mrs. Troup will be sincerely mourned, not only by a large family, but by a very wide circle of friends.

Our boys will play the Rochester ball tossers the return game of ball in the above city August 22. The Rochester team were not satisfied with the drubbing they got here but want it "rubbed in." I wish you would allow me to say that the able report of the game played here and signed "W. S." was not by his pen at all. If it had been of course it would have read different. W. S.

Recent Legal Decisions.

Right of Surviving Partners to Carry on Same Line of Business.

Upon the dissolution of a partnership firm by the death of one of its members the surviving partners may carry on the same line of business at the same place as was transacted the firm business, without liability to account to the legal representative of the deceased partner for the good will of said firm, in the absence of their own agreement to the contrary. *Lobeck v. Lee*, Sup. Ct., Neb. 55 N. W. Rep. 650.

Unfair Competition on Part of Vendor of Good Will.

The good will of a business comprises those advantages which may inure to the purchaser from holding himself out to the public as succeeding to an enterprise which has been identified in the past with the name and repute of his predecessor. Any conduct on the part of a vendor of a good will, calculated to impair the value of these advantages, is a breach of promise, implied in sales of every description, that the vendor will not disturb the vendee in the enjoyment of his purchase. *Knoedler v. Glaenger*. Cir. Ct. App. 55 Fed. Rep. 895.

JACKSONVILLE, ILL.—The florists at this place are well awake during the dull season; they are hard at work preparing for winter. The plant of Mr. Jos. Heisl looks fine; he has the finest carnation plants the writer ever saw at this season of the year. He is rebuilding his old houses.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

GRAFTON, MASS.—Frank Fisher is about to build an addition 200x14 feet.

St. Louis.

The Houlihan Floral Co., a new firm, has begun the erection, at the west end, of seven greenhouses, 20x100 each. The houses will be devoted principally to the production of cut roses for the wholesale trade. It is the intention to increase the plant to twenty houses next season.

CORFU, N. Y.—Webb Brothers have just completed the re-planting of three of their large greenhouses to roses, the last one containing 1,700 young plants. Their stock consists of American Beauties, Meteors, Mermets, Brides and La France.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

WE request subscribers to make remittance by draft or money order when renewing subscriptions, and to keep a record of the numbers and dates of same. This is to guard against losses in the mails.

CHESTER, PA.—Thomas Delabunt, the Chester florist, is building two new greenhouses, each 20x100 feet.

Address THE AMERICAN FLORIST CO., Chicago.

A World's Horticultural Society.

At meetings held August 21 and 22 in the office of the Chief of the Horticultural Department of the World's Fair, action was taken looking to the organization of the "World's Horticultural Society." While the meeting was not as representative as could be wished and action was rather hastily taken, it is to be hoped that the errors of haste may be corrected and the work laid out on the broad lines necessary to make such a society of real and permanent value. The meeting even went so far as to elect officers, which are as follows: President, P. J. Berckmans of Georgia; Vice-President, Henri L. de Vilmorin of France; Secretary-Treasurer, Geo. Nicholson of England. Under the plan adopted the president is to appoint a secretary-treasurer for each country represented in the society. One plan was that the society should be, if possible, a federation of existing horticultural organizations, that all might work in harmony together in matters of international interest, but an amendment that was adopted provided for individual membership also. Still the whole project is yet in the rough and the plan adopted is so elastic that objectionable features can be eliminated and useful ones added. Some 18 or 20 have handed in their names as members and the list is at present in the office of Chief Samuels in the Horticultural Building at the Fair, where those interested may call and add their names on payment of the individual membership fee, which is \$2.

CROMWELL, CONN.—A. N. Pierson has commenced the erection of two new greenhouses, each about 250 feet long.

LIVINGSTON AND THE TOMATO is the title of a book of 172 pages by A. W. Livingston; it contains a variety of information concerning this favorite vegetable, its culture and varieties (A. W. Livingston's Sons, Columbus, Ohio, publishers).

PEORIA, ILL.—Business has been fair for summer trade. Cut flowers scarce and poor quality. Outside of funeral work the florists have had little cut flower work. No storms have struck us, but we are all on a strike for rain. Cole Bros. are pulling down old houses and re-building. The firm of Shoaff & Wiley is dissolved.

NEW ORLEANS.—At the last meeting of the Horticultural Society the annual election of officers took place, with the following result: President, Mathew Cook; vice-president, J. H. Menard; secretary, Paul Abele; treasurer, John Ehlen. The election was followed by a supper. Business is very dull, and the extreme drouth has been very hard on plants outside.

Florists' Hail Association.

The annual meeting of the directors of the Florists' Hail Association, held at St. Louis, elected the following officers: J. M. Jordan, president; James Horan, vice-president; John G. Esler, secretary; M. A. Hunt, treasurer. Mr. J. C. Vaughan, the former treasurer, felt unwilling to retain the office unless a sufficient salary could be paid to secure an assistant. No amendment having been offered to ask for such increase the only alternative was to elect another treasurer, and the directors were more than fortunate in securing Mr. M. A. Hunt for the position. Mr. E. G. Hill, the first treasurer, dropped the office because he found it impossible to give it his attention, and Mr. Vaughan now does likewise. Very few persons know the amount of work that is thrown upon the executive officials of the association, and those who have filled the positions heretofore have done a great deal of hard work to make the association successful with but trifling compensation.

JOHN G. ESLER.

WILLIAMSPORT, PA.—Evenden Brothers have finished building a handsome range of new greenhouses, comprising one 18-foot even span house for carnations and two three-quarter span 18-foot rose houses. Each of the rose houses have a violet pit in front and a propagating house at the back. All the houses are 110 feet long and will be heated with steam. The rose houses are planted with Perles, Brides, Mermets and Niphotos, and the carnation house and violet pits are being rapidly prepared to receive their occupants. The steadily increasing trade of Messrs. Evenden Bros., has rendered this addition necessary.

THE ANNUAL REPORT of the American Association of Nurserymen for 1893 has been issued. It contains a full record of the proceedings of the last convention and like all the reports of this association is an exceedingly interesting and valuable document to the nurserymen of the country. Membership in the association (which entitles to the report) may be had on application to the secretary, Mr. George C. Seager, Rochester, N. Y. The annual fee is \$2.

WEST CHESTER, PA.—The greenhouses connected with the nurseries of Hoopes Bros. & Thomas, together with a large part of the contents, were destroyed by fire on August 13. Supposed to have been incendiary. Loss \$5,000.

SPRINGFIELD, MASS.—President Geo. S. Lewis of the Hampden County Horticultural Society has resigned. The midsummer show of the society on August 11 and 12 was a pronounced success.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

St. Louis.

After the excitement of convention week things here appear to be more than usually quiet. The heat has increased somewhat and the lack of rain is making itself more apparent upon shrubbery and lawns outside the reach of city water. Trade is at a standstill, but hopes are entertained that in a short while the returning pilgrims from the various resorts will start it into life again.

C. C. Sanders is building a "short span to the south" house eighty feet long between two of his older houses. Its working will be watched with interest, as it is the only one of its kind in this neighborhood.

Work has been stopped upon the conservatory and rose house being built by S. Kehrman, of the Elleard Floral Company, owing to complications arising from his being away from town. It is expected, however, that as soon as he returns from the east, where he is summing, work will be resumed and finished in short order.

Thompson, Anderson & Kennedy are building a house for Benton Park, converting what was a lean-to into a three-quarter span, virtually making a new house of it; the dimensions are eighty by twenty.

The automatic ventilator that was shown at the convention is to have a practical test in this city. Mr. Schray will fit up a 100x20 foot rose house, built this season, with two machines; and the Michel Plant and Bulb Company have also decided to give them a trial, but to what extent is not as yet known. The outcome will be watched with interest, and if the results obtained are as good as under the old methods they will prove a veritable boon.

The C. Young & Sons Company have recently let the contract for putting in another large boiler so as to have a reserve in case anything should go wrong. It will be larger than the one they have in now, being several feet longer and of a larger diameter; the flues will be the same size, 6-inch. When finished this will give them one of the most complete modern greenhouse heating plants in the country.

Mr. Jablonsky, whose place was inundated this spring owing to the caving in of a temporary sewer, has had a hearing before a referee, and the estate causing the damage has offered to compromise for \$600. This is not satisfactory and an appeal has been taken to the Circuit Court. The estate is involved and can only pay creditors about fifty cents on the dollar; this is an additional reason why heavier damages should be awarded.

Mr. Emil Schray is spending some time in Chicago seeing the World's Fair. From present indications there will be quite a few St. Louisians who will be unable to get to the Fair. Mr. James Young has recently returned from a trip to Atlantic City, and is rapidly losing the increased weight obtained by a several weeks' sojourn there. R. F. T.

PANSIES.**THE BEST ARE THE CHEAPEST.**

SIZE is a strong point in Pansies; when you combine size, color, substance and form they are pretty near right. By careful hybridization and selection I have accomplished this, and the Pansies I send out this Fall will be an agreeable surprise, even to former customers. If you buy Pansies I would be pleased to correspond with you; they will be offered for sale from Aug. 20th to Dec. 1st, at 75c. per 100 or \$5 per 1000. Terms cash with order or C. O. D. No seed for sale.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed BOLANZ BROS., Akron, O.

250,000 FINE FERNS.

Our stock of young Ferns is greater this season than ever. The plants are just in proper condition to shift on into 3-inch pots for use in jardinières and fern dishes during the fall and winter.

During the past five years there has always been a great scarcity of this stock from the holiday season on, and this year will be no exception. You cannot go amiss by laying in a stock now and growing them on.

As our stock is nearly all grown in open frames, it is in a well-hardened off condition and will stand shipment by freight, except to very distant points, thereby saving heavy express charges.

Toronto.

The Gardeners' and Florists' Association held its regular monthly meeting last week, and managed to clear off the business on hand in about an hour. The Chrysanthemum Committee was ordered to get out the final prize list before the next meeting. Mr. A. Gilchrist, the worthy vice president, who has just returned from Chicago, presided. Of course the boys wanted to hear about the World's Fair, and Mr. Gilchrist gave them as much as could be crowded into a conversational speech of fifteen or twenty minutes, and told them that all who could possibly make it convenient should go and see it for themselves, as no description could give them any idea of the reality.

I am sorry to have to say that not one Torontonian attended the convention at St. Louis this year. All have excuses, distance too great, trade bad this year, built a house, married a wife, an ox to prove, etc.

Flower beds are now at the height of their beauty. Soon the cool nights will come and take the gloss off the coleus, and the wind and rain will beat the bloom and make it tired looking. There are some quite noteworthy sub-tropical beds about this year, in which the plants have done remarkably well. E.

BROOKLYN, N. Y.—There will be erected during the fall, on the Ninth avenue side of Prospect Park, near Eighth street, a building to be known as the "Display House," in which flowers and plants from the greenhouses will be attractively arranged for a continuous floral show. The structure will be plain, with dimensions of 83 feet by 35 feet and about 35 feet high. The object of the building is mainly to provide a flower display for winter.

E. HIPPARD, Youngstown, Ohio.

When writing to any of the advertisers on this page please mention the American Florist.

Chicago.

Trade is very dull and flowers generally medium in quality, though roses are improving. Carnations are very poor. Gladiolus is suffering from the dry weather, so are tuberose, which are quite plentiful, but not very good in quality. Asters are far ahead of the demand. The supply of auratum lilies is lessening. Sweet peas are almost gone. The dry weather is affecting all outdoor stuff very much; the carnations seem likely to suffer a good deal.

A recent corporation is the Brant & Noe Floral Co., of Chicago. Capital stock, \$40,000; incorporators, D. W. Brant, Louis Danziger and Walter Hannon.

Among the recent visitors were: James Morton, Clarksville, Tenn.; H. C. Quillin, Dallas, Texas; Stephen Taplin and Orrin Scotten, Detroit, Mich.; W. F. Gude, Washington; Frank Bucksatt, Jr., St. Louis; Jno. E. Lager, Short Hills, N. J.; J. T. Temple, Davenport, Iowa; Gus Knoch, Detroit, Mich.; J. Comont, London, England; T. G. Armstrong, Milwaukee, Wis.; E. F. Lemke, St. Paul, Minn.; L. E. Bayles, Wilmington, Del.; I. Larkin, Toughkenamon, Pa.; S. A. Anderson, Buffalo, N. Y.; J. J. Lampert, Xenia, Ohio; W. Greene, Davenport, Iowa; Wm. Dihm, New York City; Theo. Bock, Hamilton, Ohio.

California Nurserymen's Association.

At a meeting of California nurserymen, held at San Francisco August 14, an association was formed with the above title, with officers as follows: G. C. Roeding, president; Leonard Coates, vice-president; R. D. Fox, San Jose, secretary; John Rock, treasurer. Executive Committee: W. P. Harmon, J. Waters, A. F. Boardman, John Rock, C. C. Royce.

At the meeting a resolution was adopted indorsing the action of the California State Horticultural Society in inviting the American Pomological Society to hold its next meeting in San Francisco.

Catalogues Received.

Vilmorin Andrieux & Co., Paris, France, bulbs and seeds; H. Gusmus, Klagenfurt, Austria, bulbs and plants; P. J. Berckmans, Augusta, Ga., trees and plants; Osman & Co., London, England, garden tools, etc.; Chas. D. Ball, Holmesburg, Phila., Pa., palms, ferns, etc.; Emil Liebig, Dresden, Germany, plants; W. Pfitzer, Stuttgart, Germany, plants.

Patents Recently Granted.

Bouquet holder, Joseph Mathison, Somerville, Mass.; Artificial stem for cut flowers, Harry H. Francis, Madison, N. J.; Holder for bouquets, Herman C. Wiedenmann, Philadelphia.

BULBS AND TUBEROUS ROOTED PLANTS is the title of a new book by C. L. Allen. Its subjects are indicated by its title; it covers all our popular bulbous and tuberous plants, their growth and culture, and will be found a useful reference work to both florists and amateurs. It contains 311 pages and is freely illustrated. (Published by the Orange Judd Co., New York.)

Hybridization: Its Benefits and Results to Ornamental Horticulture.

[Presented at the St. Louis convention of the Society of American Florists by Dr. J. M. Macfarlane, Lansdowne, Pa.]

It may fairly be said that three great agencies have been at work during the past century to increase the number of cultivated plants. These have been the introduction of new species, the selection of sports, and the hybridization of species already in cultivation. It would be hard to say which of the three agencies has been the most potent, but it is a fact that many of our choicest garden ornaments of to-day are neither species nor sports, but hybrids that have themselves been so crossed and recrossed that to unravel their parentage would be hopeless. As proof of this we need only cite the pinks, pelargoniums, begonias, heaths, rhododendrons, gloxinias, gladioli, etc. Such results are the best possible proof that hybridization has immense possibilities for the florist. The great improvement of many hybrids over either parent is a valuable feature in itself.

Though it is now approaching two centuries since Fairchild raised the first hybrid that was recognized as such, it is scarcely more than half a century since gardeners started in earnest to the work of hybridization. Kolreuter may well be designated the father of hybridizers, for from 1760 till near the time of his death in 1806 he devoted his best energies to the scientific rearing and comparison of parent and hybrid forms. The altogether unexpected results he obtained in crossing species of such genera as dianthus, malva, lobelia, nicotiana and mirabilis at once showed the way and supplied the stimulus to gardeners, who—to their praise he it said—were not blind to the hint thus furnished. But the gardening world was first aroused to the height of anticipation when a couple of well known cultivators entered the field in the persons of R. Gowen, gardener to Lord Carnarvon, and Dean Herbert, the amateur, but enthusiastic florist. As the two brought forward successive crosses of the then fashionable ericas, as well as of rhododendrons, gladioli and amaryllis that still find high favor, the natural outcome was that every gardener became a hybridizer. During the first half of this century, therefore, the number of garden hybrids increased greatly, while the price at times realized for some lucky batch of seedlings was a windfall to the owner.

More recently the careful, scientific experiments of Gartner, Naudin, Godron, Wichura and Darwin gave a firm foundation to the subject, while the innumerable varieties of pelargoniums, fuchsias, rhododendrons, petunias and orchids testify that the florist has not been resting on the laurels which his predecessors gained. But all this notwithstanding, he has too often approached his experiments in a very

haphazard frame of mind. True, some of the leading continental firms so realized the importance of the work to be done that they engaged men for it who became specialists. Dominy, Seden, Kellermann, Turnbull, Grieve and others amply deserved the name. Like other industries and pursuits the rearing of hybrids is one the importance of which has not been fully realized in America. Till within the last few years there has not existed here the type of wealthy, leisured and cultured men, who can appreciate such products, and are prepared to spend large sums in order to obtain them. But while a change for the better is at present going on, is it not true that this country has at times fulfilled its mission best when it has gone outside itself to compete with other nations? Why should it not do the same in the production of new and valuable crosses? I am glad to know that already a beginning has been made and that hybrid orchids from American raisers have been willingly awarded their meed of praise.

System and method are characteristics of the universe and should be also of those who propose to enter the list of hybridizers. Want of system and method has sadly shown itself in the past, so that the market has been flooded with hybrids whose parentage is unknown, and the means adopted for the obtaining of them is unrecorded. Every gardener then should have a pocket notebook as a constant and cherished companion. I could not help admiring the system adopted by a well known orchid grower of England, whose stock of hybrids is almost without a rival. A large, well bound volume contained a record of every experiment conducted. The time of opening of the parent blossoms, the date when cross pollination was effected, remarks on the ripening of the capsule, the period when it was plucked, the time of sowing of the seeds and the nature of the soil in which they were placed, the first appearance of the seedlings and the date when these were pricked off into pots were all duly entered. By such means he commanded success and it has come to him. How unlike the all too common reply made by many, when asked only it may be as to the parentage of a cross, "Well, Golden Queen was the seed parent and I think Silver Gem was the male."

If it be asked now, What flowering plants will hybridize? the answer is difficult to give, for our sad lack of knowledge on many points must be confessed. It has been demonstrated that the pollen grains of one species when put on the stigma of some species belonging to a different order or even sub-class will protrude pollen tubes that may reach the ovary or even the ovule. But the operation seems to be largely physical and there stops. It can be laid down as an ascertained law that only forms which

are more or less related to each other will cross. But we do not mean to imply by this that in habit, environment, flower color and odor the two should resemble each other closely. Witness the hybrid between the slender, twiggy, small flowered *Rhododendron Dauricum* and the tall, large flowered *R. arboreum*, or between the dense, wiry Patagonian shrub, *philesia*, and the tall Chilean climber, *lapageria*. These indicate to us the outer limits of possibilities, so to speak, but the fact that hybrids of such never or rarely bear seed teaches us that natural limits have been overstepped by human art. Since hybrids between species of *dianthus*, *pelargonium*, *begonia*, *petunia* and others are to a large degree fertile this indicates that the inner limit shades off into cross fertilization of individuals of the same species.

A very important matter in hybridization is the skillful and judicious selection of appropriate parents. It seems inevitable that embryo hybridizers always attempt at first to get marvels, rather than improvements. They wish to lead nature, instead of being content to put their hand in hers. "Improvement" then should be the hybridizer's watchword, and we predict that this can best be attained by a thoughtful study of the parent species. Let us illustrate by one or two cases. The deservedly popular and early blooming *Rhododendron Nobleanum* is a cross of the low-growing, white flowered *R. Caucasicum* with the magnificent scarlet *R. arboreum*. But, as grown in English gardens, the leaves of the former parent are liable to the attack of an insect that riddles and browns them. The weakness is powerfully inherited by the hybrid offspring, and is decidedly against it in the florist's eyes. The selection of our native *R. Catawbiense* instead gave the well known strains of which John Waterer is an example, and these are free from the defect indicated.

No better illustration can be given, I think, of the inferior qualities of two selected parents being subordinated to the good points of both in the crossed offspring than in *Nepenthes Mastersiana*. This form has done more to popularize the pitcher plants than any species or hybrid yet brought forward. The one parent, *N. sanguinea*, has ample bright green leaves that bear scarlet crimson pitchers of graceful shape and large size. But the plant tends to become "leggy"; it pitchers rather inconstantly and is often difficult to propagate. The other parent, *N. khasiana*, has narrow gray-green leaves, long narrow pitchers of a greenish hue tinged and streaked with brick red—not highly desirable acquisitions—but it pitchers at every leaf usually and is easy of cultivation. The hybrid, in habit, in leaf form and color, in shape and coloring of the pitcher, and not least, in its free mode of propagation, is all that could be desired.

Since it is a general rule that as we approach the tropics the wealth and coloring of flowers increase, one aim should be to cross good hardy forms with others of a more tender kind, for people do not want to grow all their plants the year round in glass houses if they can do otherwise. Then, too, since hybrids remain truest in type when propagated otherwise than from seeds, if one proposed parent that has good points be an annual or biennial, one that is perennial should be chosen as the other parent. Good illustrations of this are to be found both among natural and artificial hybrids. "Habit" is an important item with florists, and the improved crossed

strains of *begonia*, *canna*, etc., are known to all of you. The quality of the flowers, however, largely determines the value of the plant. But "the quality of the flowers" is a complicated problem, since size, shape, color, perfume and duration may all have to be considered. A skillful study of these may insure a hit when otherwise there would be mediocrity or a failure. Few hybrids in their blooms set off the good points so well as one that has had a wide though questionable reputation, and yet is little known to cultivators. I refer to *Bryanthus erectus* of Graham; a well grown plant of this, not to say a bed of it, is a sight indeed. As color is an important consideration, needless effort may be saved by avoiding the crossing of species that have yellow and purple, or scarlet and dark blue blossoms. While I know a good many ugly combinations of the above, the only passable one is that between the cardinal and blue lobelias, which is not uncommon in the wild condition with us, and has repeatedly been produced artificially.

All experimenters practically agree that some genera and species cross much more readily than others. Where striking differences exist in the structure of the two parents the probability of blending is correspondingly reduced. In spite of this the man would be rash who would attempt to predict with our present knowledge that certain species cannot be crossed. Look up the literature of twenty years back and you will read that the currant and gooseberry, the red and blue pimpernel, as well as others that might be named, refuse to blend. Yet we have hybrids of them now. They yielded to steady and determined effort. The group of orchids, however, should be an example and encouragement to all. Till within the last quarter of a century few artificial hybrids, and only a few wild hybrids of the orchid order, were known, the order itself being viewed as of minor hybridizing capacity. But the rage for novelty and improvement taxed the skill of the gardener, while the prices willingly paid for good novelties furnished the incitement. He set himself to understand the curious structure of the flower and to his aid came Darwin's classic work. The order now stands first as having furnished the greatest number of hybrids, the most varied combinations and the most beautiful results. It cannot be too strongly stated, however, that these achievements have been accomplished by a skillful selection of parents and a knowledge of the cultural treatment that best suits them from the seedling on to the adult's age.

It has been generally accepted as an axiom that species with irregular flowers cross more readily than those with regular blossoms, and a superficial review of garden forms seems to confirm the opinion. But if we stand back and allow nature to speak for us here, she will utter a word of caution. Such genera as *anemone*, *ranunculus*, *aquilegia*, *dianthus*, *hypericum*, *vitis*, *rosa*, *geum*, *rubus*, *cpilobium*, *rumex*, *salix*, *narcissus* and *carex* claim the large share of wild or natural hybrids. How then has the popular fancy originated? Simply, we believe, because irregular flowers always have a charm for cultivators that is only equalled by that of the finest regular species. Nature, we say, works most easily on regular forms, and this fact should be kept clearly in view for the future. During the past quarter century irregular ones have been the favorites, the *begonias* only being to a degree an exception. We do not wonder that it has been so, for irregular

shape and showy or varied coloring usually go hand in hand, while the halo of light that Darwin and his successors have shed round their structural relations makes everyone desire to imitate the insect or humming bird, even though they do not claim the nectar for their trouble. We say then that among our showy regular flowers is a neglected field waiting to be cultivated.

No question probably in the whole range of our subject has been so debated, or had so many theories tacked on to it, as that which deals with the relations and resemblances of a hybrid to its parents. Though careful scientific students like Kolreuter, Gartner, Naudin, Wichura and Darwin favored the view that hybrids are averagely intermediate between the parents, their eyes were open to the fact that the appearance of erratic and divergent forms occasionally seemed to weaken their position. Among florists the aim appeared often to be the obtaining of marvels rather than improvements, and so the many evenly balanced crosses were less noticed than the divergent ones. Our gardening journals for decades presented articles in which the prepotency of the male parent was warmly supported by some—and we should judge by the majority—while that of the female was as keenly held by others. From extended observations that the writer has made alike on living plants and on their minute tissues, he adheres to the view that an average hybrid is nearly intermediate between its parents. But it is to be remembered that if individuals of the same species are built up of unstable and easily decomposed chemical compounds such will probably be truer of a hybrid, which may well be regarded as an attempt to make two diverse things balance as one. We need not be surprised then that so many freaks appear, some of which vibrate toward one parent, some toward the other.

Many of you may be inclined now to ask—What remains to be done by the florist? To that I answer, "Nearly everything," and I am persuaded this correctly expresses the true position of affairs to-day. My reasons for giving the answer are: First, that many of the finest flowering plants are not yet in cultivation. Take, for example, the exotic field that lies most conveniently to ourselves. I mean central America from New Mexico to the Argentine Republic. Though we are already indebted to that vast region for many of our best stove and greenhouse plants, its resources have scarcely been touched except in the matter of orchids. The same is true also of central Africa and Asia, of New Guinea and many of the Pacific islands. Second—If we take as a criterion the work done among a few species during the last twenty years the answer is a correct one. Third—If we consider the limited facilities and the many hindrances that have hitherto existed in conducting pollination experiments the wonder is that so much has been done. The hybridizer has frequently to accept as parents not what he will, but what he must. He may wish to cross two species from whose descendants he hopes for great things, but he has only one parent in flower. He hunts up his gardening friends to see if they can supply pollen of the other or of some suitable parent. Happy is he if his search is successful.

In speaking as I have done of exotic plants do not suppose that I discourage the culture of our native plants. Far too little attention has been given them. But what, it may be asked, are the groups

VIEW OF PART OF NEW YORK STATE DISPLAY IN ONE OF THE SMALL GREENHOUSES AT THE WORLD'S FAIR. SHOWING ARISTOLOCHIA WITH SIX FLOWERS SUSPENDED FROM WIRE ACROSS CENTER OF HOUSE.

that deserve attention? We have a wide field to choose from, but I can only indicate a few. Some of our native and exotic polygalas have a habit, floral structure and color that entirely commend them. The St. John's worts or hypericums are now becoming favorites on rockwork and in herbaceous borders, and though natural hybrids have now and again been recorded, the pretty *H. Moserianum* is an artificial one of recent date that all speak well of. Others should be forthcoming. It is surprising that so few of the Malvaceae have hitherto been worked. Our native swamp mallow (*Hibiscus Moscheutos*) is a noble plant, and if crossed by a dwarfier species something very distinct might be gotten. *Hibiscus*, *abutilon* and *malva* are all deserving of attention.

Pelargonium has hitherto ruled supreme among Geraniaceae, but why is it that the genus *oxalis*, cultivated for more than a century and including nearly 250 species, has yielded only a few sports and still fewer hybrids? We venture to predict that were crossing and selection practiced here the *oxalis* would again become the favorites they once were. Equally true is it of *impatiens*. Some fine species are now common, and, though annual, their rapid growth and wealth of blossom puts them alongside the *petunias* that have had so much favor shown them.

It has always seemed to the writer remarkable that the pea order should have furnished so few crosses even under

cultivation. Neglect may be the simple explanation. Already we have the gorgeous hybrids of *Brownea*, but the whole group is practically untouched. Skill and care will be needed in manipulating them. As already indicated, nature shows us that the rose order is an inviting one, but though fine hybrids of *rosa*, *geum* and *potentilla* are in cultivation many herbaceous, shrubby and tree types remain to be taken in hand.

I should like to linger for a little over the Onagraceae. The successes wrought on the continent with *luehsia* from the southern hemisphere should meet with a response from Americans in the species of *Oenothera*, a genus that includes nearly a century of species, mostly western American. Such lovely evening primroses as *O. Whitneyi*, *O. marginata* and *O. cœspitosa* might have their rather short-lived flowers prolonged, their habit improved and their scent accentuated by union with *O. speciosa*. Or some of these again might be combined with the large yellow flowered species. In aiming at such crosses our florists should not think only of the short twilight prevalent over many of the states, but of the longer one enjoyed in England and other European countries where these handsome plants are eagerly welcomed.

If any order deserves to be called American and *par excellence* St. Louisian, that is the Cactaceae. The ease with which they can be crossed and the small care needed in their cultivation are most commenda-

ble qualities. If we may judge from past experience the order lends itself well to the hybridizer, as is proved by the union not merely of *cereus* and *phyllocactus*, but of these again with *epiphyllum*.

We spoke of Central America as a source of supplies, but the wealth of such rubiaceous genera as *plumiera* would alone furnish material for extended work. The remarks made regarding the pea order equally apply to the still larger group of the daisies and sunflowers. Many wild hybrids of the hawkweeds and thistles are known, but garden hybrids are rare. Yet see how much success has come to the Erfurt strains of *zinnia* and to the now time-honored *dahlia*. These are finger posts to the florist in the truest sense. Did time permit, the heaths, the milkweeds and many others might be noted, but one group cannot be passed over. All who have seen a well grown specimen of *Bignonia venusta* clambering over some Florida home or wreathing the roof girders of a hothouse further north have stopped to admire. It and its allies are choice climbers. Blending of such hardy species as *B. capreolata* and *B. grandiflora* with other yellows and reds, also of *B. speciosa*, *B. purpurea* and the lovely Mascarene *B. telfairiae*, would be noble work in itself.

Among Monocotyledons the orchids, *cannas*, *hedychiums* and *amaryllis* have been so prolific in blending that we may safely take them as an index for all, and as a verification of my position that

however much has been done the serious work and best fruits are yet before us.

In conclusion let me suggest to some enterprising florist an idea that has often occurred to me. All leading commercial governments of the world are now wisely establishing stations for rearing, propagating and distributing economic and other plants. Would it not repay the efforts of private firms to do likewise? Mexico and central South America are rich fields that are daily becoming more accessible. Such a forward step might mark the commencement of fresh triumphs in the floral world.

The World's Fair.

Just now the great feature at the Fair is the canna display, which will continue in fine order from now until frost. It is, without doubt, the finest canna display ever collected in one place, and it affords a fine opportunity to compare various varieties. The exhibitors are the F. R. Pierson Co., J. C. Vaughan, Pitcher & Manda, H. A. Dreer and Robt. Craig in the main display, while I. N. Kramer & Son show some seedlings west of the large building.

At the south end are some mixed beds from Pitcher & Manda, and beds filled with one variety only from the F. R. Pierson Co. Alphonse Bouvier is in fine order; the brilliant red flowers and rich green leaves make a fine contrast, and it is blooming most abundantly. Capt. P. de Suzzoni, yellow, spotted with red, green leaves, is one of the best of the yellows and is covered with flowers. Mme. Crozy we are all familiar with, and it is doing well. Chas. Henderson, a variety with brilliant deep red flowers, is a very compact dwarf grower and should be desirable bordering taller sorts. Explorateur Crampel is a dwarf red flowered sort, but it does not seem so free as Chas. Henderson, at least it is not blooming so freely in its present situation. Francois Crozy is a very dwarf sort with brilliant orange flowers; the flowers appear to stand very well, not burning so much as some of the lighter ones. Paul Bruant is a dwarf variety with scarlet flowers, borne in tall spikes. Count Horace de Choiseul is very dwarf with bright red flowers.

Among sorts with bronze foliage is J. D. Cabos, with deep orange flowers. It has a fine habit and is blooming freely, but the flowers appear to burn easily, and their effect is spoiled by the bleached, faded petals. President Carnot is a bronze-foliaged sort with bright red flowers, and it appears to be one of the first rank; it is very handsome.

Paul Marquant is an attractive sort with beautiful light scarlet flowers and rather narrow green leaves, but it does not give the impression of so strong a constitution as some of the others. The same impression is given by Miss Sarah Hill, red flower and green leaf, although this last named sort has a good habit. Secretary Stewart is not at present blooming very freely; it has handsome red flowers, green leaves, and a robust habit.

J. C. Vaughan's exhibit in front of the main entrance is in fine order; in addition to some of the varieties previously noted it includes Mlle. Crillon, yellow flowers shading to deep apricot, and Florence Vaughan, yellow spotted with red. Florence Vaughan is really one of the very best in its color, it is free, robust, and the flowers stand well.

On the north side are H. A. Dreer's and Robt. Craig's exhibits. Enfant du Rhone

has a pleasing reddish apricot flower, but the growth is rather slender. Duchess de Montenard has a yellow flower, shading to apricot; the leaves are large and the habit very robust. Baronne de Renowardy has good light red flowers, rather slender growth and pointed leaves with curving edge. Statuaire Fulconis is another red flowered sort, but did not make a very good impression. Edw. Michel is a very good one, with brilliant orange red flowers.

Among varieties shown in Robt. Craig's exhibit, which were not duplicated in any other display, is Egandale, an excellent bronze-leaved variety with bright scarlet flowers; Geo. W. Childs, red, with golden markings, and a new unnamed seedling, with yellow and apricot flowers. The beauty of these great beds can not be understood without seeing them; they are remarkable, set in the rich green lawn without conflicting plants in their vicinity.

I. N. Kramer & Son have a very good red flowered seedling in bloom west of the Horticultural Building. It is called Columbia and is very good in color and habit.

The nymphæas are now blooming more freely, both in the inner court and outside the Horticultural Building. The new N. Laydekeri rosea is in bloom in Wm. Tricker's exhibit; it is a distinct flower, in color a deep rose shaded with violet. Other nymphæas in bloom in this exhibit are N. Zanzibarensis, N. gigantea, N. Marliacea rosea, N. Marliacea alba, N. Marliacea chromatella, N. gracilis, N. Devoniensis superba, N. odorata sulphurea, and N. pygmaea helviola, a yellow form of the tiny pygmæa. A number of nymphæas are blooming in the Sturtevant exhibit in the south court and the little floating heart, or water shield (*Limnathemum indicum*), is showing an abundance of its odd little blooms. But the foliage of the aquatics in both cases is much marred by the clouds of dust; these basins ought to be surrounded with lawn for the sake of the foliage.

On the Island the phlox is still fine, and *Hydrangea paniculata grandiflora* is blooming finely. Another shrub which looks well now is *Cassia Marylandica*, the American senna, which shows ample spikes of yellow pea-shaped blossoms.

Seasonable Hints.

Florists suitably located for a retail trade will have quite a demand in the fall for pot grown carnations if the right kinds, well grown, can be produced. For this purpose it is well to select the plants early, choosing good bushy plants of such varieties as make a compact growth. As very suitable for the purpose we would mention the following: Buttercup, Century, Tidal Wave, L. L. Lamborn, Portia, Mrs. Fisher, Grace Wilder, Wm. F. Dreer, Golden Gate, Seawan, E. G. Hill, Pride of Kennett, Sunrise, Dawn, American Flag, Robt. Craig, etc. The tall straggly growing sorts as a rule should be avoided. These may be lifted from the field the same as if we intended to plant them in the bench. Pots should be chosen of suitable size, 5 or 6-inch being mostly used. A pretty large plant can be put in a 6-inch pot. Use the ordi-

nary compost for potting, settling the soil well and firmly around the plant. Set them in the house, giving them room enough on the bench to grow, leaving a little space about each plant for air and light. Treat them similarly to the plants that are in the benches. They will soon take hold and make fine plants for the sitting room or conservatory.

For spring sales there is nothing better than the smaller plants from the field, carried over in cold frames or a cool house. Three-inch pots will carry these through the winter. They should be kept pretty dry, and a little freezing will not hurt them. Towards spring they may be repotted and set in a warmer place to start them into growth. They should be topped at this time to insure a good stocky growth. Such plants also make excellent stock for summer bloom. For this purpose they should be held in the frames and planted out in open ground as soon as the ground can be got ready for them and the weather will permit. They can then be treated pretty much as other plants growing in the field, only a light mulch of cut straw should be strewn in the rows to keep the flowers clean. This is easier and cheaper than staking.

As a summer-blooming plant carnations are very much neglected in this country. The attention of producers has all been given to obtaining winter blooming kinds. But we have no doubt time will produce good summer blooming varieties of our American carnation. We have no faith in the foreign sorts for this or any other purpose excepting their use in cross fertilization. It seems that the American carnations are decidedly the best for this country, and it will not be long before we have them suitable for all purposes.

W. R. SHELMIER.

Avondale, Pa.

Grub Worms.

In reply to the question about grub worms, from the Kemble Floral Co., would say that the worms they complain of in their manure are simply the larvæ of the common horse fly, belonging to the family *diptera*; these so-called grubs I have never found to do any harm materially to plant life. They are in the larval state some two weeks after first discovered and then gradually develop into the flies and assume their natural course.

The kind of grubs that usually do harm to roses belong to a totally different order, viz.: the June bug or chafer. This is a much larger grub, with brown head and usually a curved body somewhat in the shape of a horse shoe; these are very destructive to the roots of all kinds of vegetation. Roses seem to have a special affinity for them, or they for the roses, rather, as they will eat the bark off all around the stem just under the soil, leaving the plant to wither up and die in a very few days. The only remedy that I have found yet is "ketch 'em and kill 'em." Lime has no effect upon them whatever, in fact I think they seem rather to delight in it. The best means of destroying them that I know of is to thoroughly examine the soil before taking it into the house, then if any of them are found they can be caught before they do any damage.

There are several other kinds of grubs of various species which are more or less injurious, but fortunately for the plants are not very numerous. Wire worms are a species of grub and are injurious; also the larvæ of what are commonly called "daddy-long-legs." These are very destructive and wherever these insects are numerous they should be caught and

LAGERSTROMIA INDICA ALBA IN NEW ORLEANS.

destroyed, as they deposit their eggs in the soil and in the coming spring the larvæ will do considerable damage to the young roots. They may not cause such serious trouble as to be perceptible to the casual observer, but it is well to guard against anything that is likely to mar or injure a plant at any season of the year.

Referring to the chafer or June bug larvæ, mentioned above, they are never found in the manure but always come in with the soil. Anything in the way of trees growing in the neighborhood of the soil before collected will be very apt to give you a full crop of them, as the eggs are deposited on the leaves of the trees which fall on the ground, and from there they bury themselves in the soil and for several months before maturing are very injurious even to grass roots where they are numerous, therefore it would be well to avoid the neighborhood of trees as much as possible in collecting the soil for use in the greenhouse.

Summit, N. J.

JOHN N. MAY.

Lagerstromia Indica Alba.

The engraving is from a photograph sent us by Mr. Harry Papworth, of a handsome specimen now in bloom at Palm Villa, New Orleans. Mr. Papworth writes under date of July 31. "The plant has been in bloom as seen in the photo

for two months and will continue to bloom for another month. This is the finest white specimen in the south and it is without doubt the best and most showy flowering plant grown in this climate. It is cut back to the hard wood every year, which causes it to break very freely and also keeps it in good shape. It is a native of China, and like most Chinese plants, does well in New Orleans."

Philadelphia.

Another move in the La Roche & Stahl tangle was made on Thursday, the 25th inst., when the personal property at the nurseries in Collingdale was sold by the sheriff for \$1,575. The next day the store fixtures, stock, good will and lease at 13th and Chestnut were also sold under the same execution and brought \$244. These sales comprised all the personal property, which figured in the list of assets given the creditors as amounting to \$27,550, actual value turns out to be \$1,819. The book accounts, which are said to be worth \$5,000, can not be sold by the sheriff, though individual accounts can be attached by any creditor having a judgment.

The Market Street National Bank bought in the property and it will be managed for their benefit. This portion of the property is now out of the hands

of the trustee, and the money received will be divided pro rata among all the creditors. The balance of the assets, \$64,750, is in real estate and mortgages and is still controlled by the trustee. As all would not consent to the proposition of the firm in the extension of time the only thing that remains to do is to sell the property and divide the proceeds. It is to be hoped that the real estate will prove more valuable than the personal property, which will pay but a little over 8% per cent of its estimated value. Mr. La Roche says no matter what the estate may bring the florist creditors they will eventually receive dollar for dollar. The firm have divided their store with a partition down the middle and rented the corner property to a cigar firm. The business of china repairing which they have conducted for several years, and to which they gave up one window and a portion of their store, has been moved to No. 111 South 13th street and will be conducted by and under the name of Joseph Blachowski, a former employe.

'Tis midsummer indeed and the queen of the dog days, the aster, is everywhere abundant. Some very fine flowers and great variety of colors are to be seen, and as they keep very well the florists' windows are full of them. Vases of gladiolus and buckets of *Hydrangea paniculata* help to make a variety. The people who buy flowers when they can get them cheap enough should now have their houses decorated "up to the queen's taste," for they can be had almost for the asking.

Good roses are selling at from \$2 to \$4 a hundred, and many even cheaper. Asters bring from 25 to 75 cents a hundred. *Hydrangea* is sold by the arm full. Carnations from 50 to 75 cents a hundred, while some few ask a dollar.

"What was the matter with you fellows anyhow? The idea of letting the New Yorkers get away with you that way. If it was only a few pins, but 299, you must have all been asleep." This and similar comments were thrown at the boys promiscuously on their return home. It's bad enough to be defeated without being nagged about it, but it is human nature. If the team had won the bowlers would have had a grand time and their reception would have been all they could have wished for. There is a great deal said about a certain "scrub" team and what they did, but we venture to say that there will be no scrub teams in the race next year and there will not be very much difference between the leaders at the finish. Boston, Washington, Chicago and St. Louis will be sure to have good teams, and there is no telling of the dark horses that may make their appearance.

To a great many the World's Fair at Chicago was considered of more importance than the convention, and a number of the Philadelphia brethren skipped St. Louis and spent all their time at the Exposition. Too much can not be said in praise of this grand exhibition; any person who can possibly spare the time should not let the opportunity go by to witness this great collection of the master pieces of man. To see the buildings and grounds is alone worth the journey. There is no bedding to speak of, but we never saw such grass anywhere as there is in some of the plats along the banks of the lagoon. In the fall these spaces had been planted with thousands of tulips, hyacinths and other spring blooming bulbs, but they were never allowed to bloom, as just as the flower buds began to open they were all taken up to make room for the grass. Green and white are

the two colors of the Exposition, the green of the grass and the white of the buildings, which are all alike in this respect. There was over fifty thousand dollars spent in greenhouses and labor in getting up a stock of foliage plants for bedding, but they were all thrown out or given away, as the landscape gardener would not allow them to be used in the grounds. It was only after considerable pressure had been brought to bear that permission was given to plant the large beds of cannas which now decorate the lawn in front of the Horticultural Building.

Pictures in black and white are the pride of certain artists, while the multitude prefer those that contain more of the colors of the rainbow, and we feel sure that this is the case with the majority of the people concerning landscape gardening. Where there is one who prefers the all green landscape there are ninety-nine who would like to see all the beauties of nature spread before them.

The bedding in Washington Park, Chicago, attracts the people, there is no question about it; crowds linger about these beds all day long, and photographic outfits are continually seen on the lawns trying to carry away and perpetuate the lovely flower pictures. The plan here is not to our mind perfect, but it is a move in the right direction and no doubt the forerunner of something better. K.

Chicago.

Mr. Chas. Held, North Campbell avenue, is overhauling his forcing houses and putting them in first-class shape for the coming season.

E. Franka, Clara Place, has rebuilt a 20x80 foot carnation house.

E. Hobbs, Indiana avenue, is arranging two floors 75x90 feet for mushroom growing, a branch which Mr. H. is thoroughly familiar with.

Aug. Dresel, the veteran rose grower on North Western avenue, has built a fine new house 20x180 and is now putting in a mammoth boiler of 200 horse power. Mr. D. pushes his extensive business with all his old time vigor of 20 years ago, and his young rose plants are looking finely.

Albert J. Harms, Berteau avenue, is building a 15x50 foot carnation house.

At Ravenswood I. Naslund is putting in a new boiler for his range of nine houses and has erected a 60-foot brick chimney. Near Bowmanville Anton Then has just completed an elegant range of rose and carnation houses. There are four of the former, each 18x150 feet, and three of the latter, 16x100, with a boiler shed 40x80 and two fine hot water boilers. Mr. M. Then is in charge and the young roses are looking well. Mr. J. A. Budlong's mammoth rose house is showing up well. The careful personal supervision of all working details which Mr. B. gives to his business is a reasonably sure cure for nearly all kinds of hard times that are possible.

The drouth has checked seriously the growth of nearly all outdoor stock and many growers are taking in their carnations as well as violets.

At Morton Grove Pochlman Bros. are doing splendid work and their whole place is in apple pie order. Hüscher and Miller complain of effects of dry weather and are planting their carnation houses. Jacob Meier has added a fine propagating house 10x90 feet. His Beauties and Perles are looking extra fine. F. Stielow has put in two new 13 foot Kroeschell boilers capable of heating 20,000 feet of pipe, and has remodeled his entire pip-

ing arrangements. His outside stock looks well despite the drouth. He finds Hector a splendid summer blooming carnation. Mr. S., notwithstanding his close application to business, still finds time for his "annual convention," which consists of a hunting trip to South Dakota, where

"Thunders the sport, with gun,
And dog impatient bounding at the shot."

He has well earned his vacations.

Brant & Noe, on the old Page establishment at Forest Glen, have had a stupendous piece of work in rebuilding the entire 95,000 feet. The sides, ends and benches of all have been renewed and much of the piping has been changed, every roof reglazed, three new boilers have been put in, and in spite of the fact that this has all been done in eight weeks they have found time to plant many of their rose houses. Mr. Brant has a general supervision of the whole, ably assisted by Fred Mendoza, the foreman.

Mr. L. Ine, at the National Bohemian Cemetery, has a fine display of outside bedding. He is renewing benches and repairing heating apparatus.

In general the trade seems to have accepted some suggestions on the heating question from the past severe winter.

Mr. E. Hobbs believes that a most thorough watering of all forcing bulbs after planting in flats or pots is more important in securing good results than many growers realize.

Nicholas Singler, the well known carnation grower of Washington Heights, died last week of inflammation of the bowels, aged 46 years. Mr. Singler was born in Baden, Germany, and came to America with his parents when only 8 years old. His father settled in Englewood. Mr. Singler founded the establishment at Washington Heights 18 years ago, adding on new houses from year to year until now it is one of the most extensive around Chicago. He made a specialty of the carnation and was probably the largest grower of this flower in the west. He made his business a financial success and leaves a comfortable fortune to the widow, five sons and four daughters that survive him. The funeral was held Sunday, the 27th inst., and was attended by a large delegation of members of the Florist Club, of which he had been a member since its inception. Handsome floral tributes were sent by the club and by various individual florists also. Mr. Singler was a member of the Society of American Florists and was present at the St. Louis convention. He then seemed to be in excellent health, and the announcement of his sudden death was a severe shock to his many friends in the trade.

We have been requested by the family of the late Nicholas Singler to publicly express their thanks to the members of the Florist Club for the respect shown the memory of the husband and father through attendance at the funeral and numerous floral tributes.

For the past week business has been excessively quiet; there is really nothing doing. Flowers are plentiful, and purchasers want the best only; inferior products are wasted. The roses are chiefly from young stock and are rather small, but the color is generally good. Carnations are wonderfully improved in quality, though they are not by any means all one could desire yet. Asters are still tremendously overstocked; white is really the only color that sells. Hydrangea is seen, though not in large quantities, but the demand for it is limited. Auratum lilies are still coming in. So far there is

but little autumnal outdoor stuff to be seen, such as dahlias and the like, and it is more than probable that much of this class will be injured by the drouth.

Among recent visitors were W. W. Tailby, Wellesley, Mass.; Wm. Gammage, London, Ont.; Wm. Falconer, Glen Cove, N. Y.; W. L. Baker, Philadelphia; C. S. Ford, Philadelphia; Miss M. Ostertag, St. Louis; H. C. Ostertag, St. Louis; C. C. Sanders, St. Louis; Wm. McKellar, Chillicothe, Ohio; G. Gross, Quincy, Ill.; Olaf Johnson, Jr., Memphis, Tenn.; W. C. Jordan, Philadelphia; J. D. Imlay and wife, Zanesville, Ohio; Mrs. A. E. Markee, Reedsburg, Wis.; J. F. Wilcox, Council Bluffs, Iowa; S. Spencer, Pesotum, Ill.

Buffalo.

Base ball is not horticulture in any of its branches, but horticulturists must have a little recreation, even if times are hard, and the national game affords the best medium to that end. So you will have to excuse me if I give you a short chapter about the game of ball between Buffalo and Rochester which took place in the latter city on Tuesday, August 22.

When the Rochester men visited this city a few weeks ago we endeavored in a feeble way to entertain them, to prevent them from getting parched, etc., but oh my! how poor were our efforts when compared to what they did for us last Tuesday.

The Buffalo nine arrived in Rochester about 11 a. m., and a disjointed and uneven looking lot they were. There were two or three men among them with silver locks, who were old enough to know better, and there were kids of only 17 and upwards. As the Buffalo nine stood on the beautiful stone steps of the Rochester station the captain of the Bisons was a little ashamed of the motley aggregation. There were seven or eight carriages and private rigs waiting to conduct us to the points of greatest interest. As Richard Salter remarked, "you don't want to see any greenhouses, they are nothing more than you have yourself," so they drove in a bee line for the Bartholemey Brewing Co., one of the largest and most complete of its kind in this great state. We were conducted to the office and introduced to the proprietor and also a gentleman called "Bohemian." The first Mr. B. grasped us by the hand but once, but the second B. was around us, over us, under us, in us, and continually with us, till we discovered a mean device, viz., "If we can't outplay them on their merits we can render them indifferent to the result." A beautiful drive on both sides of the picturesque Genesee succeeded the interview with the Bohemian; another call at about as large an establishment, and then a great lunch at the best restaurant in town. Then a chartered car to Culver Park, where many a hard fought game in the International League has been played.

The game was played for all it was worth. Before the game began the second division of the Bisons arrived, in the shape of Prof. Cowell, Dan'l B. Long, Mike Bloy and S. Pickleman. There was only one player in this lot, but the quartette was sincerely welcome for they added "tone" to the Buffalo representatives. The game itself is easily told. The score was 10 to 6 in favor of Rochester. Up to the seventh inning it was a see saw and great excitement prevailed, but they got there in spite of the brilliant work of the Buffalo infield. There was a large audience to witness the game, but the cheering was naturally all for Rochester.

The great features of the game were the battery work of C. Vick, pitcher, and Ed. Vick, catcher, and the general infield work of the Rochesterers. The most noticeable work of the Buffalos was the catching of Philip Scott and pitching of M. Bloy for merit, and for rank play the fruitless efforts of J. H. Rebstock, E. Mepsted and W. Scott to catch or even stop flies. There was any number of star plays, but we were handicapped. George Savage was in the grand stand and rooting for his boys. How could we win?

"After the game was over but long ere the break of morn," we were hustled into the chartered car and landed at Ontario Beach. There are few more lovely places in this country than that. What a place to hold a national convention, with its magnificent hotels, pavilions, music, water and flowers. After seeing a man (the same man walked the Niagara gorge a few weeks ago) dance a waltz 150 feet above hard ground we were conducted to a magnificent banquet in the Cottage Hotel. There was too much music to make yourself heard, but a bashful member of the Buffalos attempted to acknowledge the prodigious hospitality of the Rochester men. A ride back to the city found us near the time to catch a flier for Buffalo. After an expression from one and all of the visitors that the welcome, the entertainment, the magnificent hospitality, had never been equalled in their experience, there was a general handshake and the man at the gate hallooed "all aboard going west." There was more than one who said, "a national convention is 'not in it' with this."

A few notes of the game of great importance were we were sadly handicapped. On our arrival at the banks of the Genesee we were first pounced on by a band of ruthless "Vick"ings, we were then "Salted," then "Fried," and then after a thorough cooking handed over to a "Savage;" but George was gentle and for the time forgot his favorite cypripedium and for the day entered into the spirit of the game in a truly barbarous style. It would be invidious for me to mention any one who did more than another to make that day enjoyable. They must all of them have exerted themselves immensely to have attained a result so complete, so grandly hospitable, that no participant will ever forget.

Allie Salter is the stayer of the boys and a few of the party not getting the first train, Allie stopped and saw them aboard.

W. S.

New York.

The cut flower trade is about as dull as it can be. By unanimous consent it is declared the poorest season up to date. Speculation as to the future, especially as to the prospects for next winter, is the most abundant commodity. Like the political giants at the national capital, each one interested has his own explanation of the present condition of the trade and the remedies for the same, and, as in the case of the aforesaid political giants, there are not two who exactly agree in their views. One thing is assured. There will be more roses grown for this market the coming season than ever before. Plenty of new houses have been erected, and good houses they are too. It is tolerably certain also that the crop of carnations will be the biggest on record. And the bulbous stock—well, that is another story.

At present the quality of the roses is by no means good. The only rose that really holds its head up and demands a first-class certificate of character as a per-

fect summer rose is the Meteor. It is coming in in grand form, the only drawback being that there are often too many of them. Another rose which is, rather unexpectedly, making some friends as a valuable summer variety is the Testout. American Beauty of course brings the highest price. Carnations are very scarce, but with veritable cartloads of asters all around, the carnations are not greatly missed. Two to three cents per bunch of a dozen or more is as high a price as can be realized on asters. Gladioli sell at \$1 to \$1.50 per hundred, and Hydrangea paniculata doesn't sell at all.

The hurrah over the accomplishments of the New York bowlers at St. Louis has not yet subsided. Theodore Roehrs, the center pin of the old aggregation, on hearing of the great victory, is said to have given his head a very wise shake and remarked, "How they will crow."

The new silver medal of the New York Florists' Club is very handsome and ought to be a prime incentive to cultivators to make an effort to produce something worthy of such an award. The medal will be on exhibition at the next meeting of the club.

Mr. John Young, formerly of Young Bros., has gone into business in his own name and has opened a cut flower commission house at 46 West 30th street. 30th street bids fair to become the leading cut flower street, there being now six wholesale establishments there.

Mr. Jas. A. Hammond, who succeeded to the Isaac Buchanan business at 407 5th avenue several years ago, has made an assignment to Z. Francis Barnes. Mr. Hammond has been concerned in some outside business, but the exact cause of his suspension is not yet known.

Alderman Morris' floral establishment in Jefferson Market is said to be a general headquarters for the bi-metalists.

THE thirty-fifth annual report of the Missouri Horticultural Society, lately received, contains the transactions of that body during the year 1892. It may be obtained by application to the secretary, L. A. Goodman, Westport, Mo.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By experienced grower. C. BARANSON, 135 W. 5th St., Oswego, N. Y.

SITUATION WANTED—As assistant florist by temperate young man. State probable wages. F. B. Lock Box "1", Sanborn, N. Y.

If you are looking for a chance, apply at once to

N. D. WINTER,
5 Elm Street, SPRINGFIELD, MASS.

The Chrysanthemum Society of America.

It is a matter for regret that at the meeting of the Chrysanthemum Society of America, held at St. Louis during the convention of the S. A. F., it was decided to again change the name of that organization. It is to be hoped that it is a reporter's or a printer's error. For when the Chrysanthemum Society of America was organized at Buffalo the name first suggested was the National Chrysanthemum Society. It soon dawned upon those who were interested that the title mentioned would not do, because the National Chrysanthemum Society of England is known by that name; besides the Chrysanthemum Society of America is more expressive as a title, and much more comprehensive.

When National Chrysanthemum Society was rejected as a name that of American Chrysanthemum Society was adopted. But realizing that the initials of the American Carnation Society were the same, and in order to allow of abbreviations when deemed advisable, the committee (Messrs. Harris, Craig and Lonsdale) having the matter of amending the constitution and by-laws in charge decided to propose the adoption of the name heading these notes as being distinctive and better than any others which have been suggested and in use before. It is to be hoped that at the meeting which is announced to take place at Philadelphia next November the matter will be thoroughly discussed and the name reported by the committee will be adopted.

The idea of holding an annual meeting at one of the large cities during the chrysanthemum season is an excellent one and should be productive of much benefit to the Queen of Autumn and all concerned. There are too many other duties to attend to by those who are directly interested in chrysanthemums at the regular summer meetings of the S. A. F. to accomplish much in the line of reforms or improvements, but a meeting each year in November is decidedly a step in the right direction. EDWIN LONSDALE.

A Correction.

In my essay on "How to increase the love of flowers," read at the St. Louis convention, credit was given to the Amateur Gardeners' Society of Springfield, Mass., for good work done in trying to educate the young in growing flowers. It seems that the *Hampden County Horticultural Society* was the society which should have gotten this credit, as appears from the following communication sent me by Mr. W. F. Gale of Springfield:

"I have read your article, 'How can we best increase the love of flowers among the people,' with a great deal of interest, and I wish to correct a slight error that refers to our city (page 14, AMERICAN FLORIST, Aug. 10). You call attention to the 'Amateur Gardeners' Society' as leaders in the good work of interesting the young. There are two horticultural societies here, the *Amateur Horticultural Society* and the *Hampden County Horticultural Society*. The former has never done anything to interest the young, unless it is to hold shows without any premiums. The society that has done so much for the children is the old *Hampden County Horticultural Society*. Three years ago they gave out 3,000 chrysanthemum plants to school children, who returned them to the chrysanthemum show in November and took premiums as per our year book, which I send you (1892). The following year we gave out 5,000 plants with the same premiums (1893 list). Last spring we did not give out the plants but doubled the premiums (see 1893 list). We expect good results at the November show."

This matter of trying to interest the young is, in my humble opinion, far too much neglected by our older societies in spite of the frequent favorable comment

which the matter has received the past few years. I hope that the committees on establishing premiums will take the matter up and give it a place in the schedules hereafter. G. C. WATSON.

Philadelphia.

FIELD-GROWN CARNATIONS.

I offer the following varieties in quantity; all strong, healthy plants, ready Sept. 10th:

Mrs. Fisher, L. L. Lamborn, Puritan, Lizzie McGowan, White Dove, Angelus, Daybreak, Mrs. Ferd. Mangold, Thos. Cartledge, Emily Pierson, Wm. F. Dreer, Golden Gate, Peachblow Coronet, Caesar. A number of other kinds in small lots. Correspondence solicited. C. J. PENNOCK, The Pines, Kennett Square, Pa.

FIELD-GROWN CARNATIONS.

Strong, healthy plants: Mrs. Fisher, Garfield, Portia, Hinze's White, White Dove, L. L. Lamborn, Bottercup, Lizzie McGowan, and power sorts.
VIOLETS—Marie Louise and Swanley White.

Address THE AMERICAN FLORIST CO., Chicago.

Boston.

Saturday, August 26, was aster day at Horticultural Hall. Each year shows some advance in quality and range of color, and this year is no exception, although the frequent heavy storms have been very disastrous to all such flowers. Pæony-flowered, Victoria, pompon, etc. were all well represented. First premium for fifty blooms including all classes was awarded to Wm. Patterson. Other exhibitors of fine asters were A. A. Hixon, C. H. Yates, F. B. Hayes, J. H. White, N. T. Kidder and Mary T. Goddard. There were also some fine exhibits of dahlia's. J. Warren Clark's show of gladioli was, as usual, good and contained a number of meritorious seedlings. The attendance was very large. The next event of importance will be the great annual exhibition of plants and flowers, which takes place on Wednesday and Thursday, September 6 and 7.

There is very little activity in the flower trade these days. A depressing feature of the present condition of things is the large number of gardeners of more or less experience who are in quest of situations. In all of the prominent florists' and seedsmen's establishments there are several such calls every day.

St. Louis.

Matters here remain in about the same condition as reported last week. Trade has commenced to stir a little and shows some signs of reviving, but is still very dull. The dry spell is still with us, although we have had several light rains, not enough, however, to be of much benefit, and outdoor stuff is suffering as a result.

The grasshoppers are more than usually abundant and are difficult to manage. When they attack stock in the open ground the best remedy found here is to turn a coop of half grown chickens, or better still, ducks, into the garden; they will soon make grasshoppers scarce.

The Jordan Floral Co. have had great success with a batch of latania seed; almost every one seems to have grown; there must be at least 10,000 in sight; this is about the largest and best take of palm seeds ever seen here.

Mr. Barnes, who resides just west of the city, is building a greenhouse 80x20 feet. He expects to use 60 feet of it for roses and 20 feet for palms and other decorative plants. This will be a private place. R. F. T.

AMERICAN BEAUTY roses were lately received from J. B. Deamud & Co., of this city. They were very fine for this season, long stemmed and clothed fully with an abundance of clean foliage.

J. B. DEAMUD & CO.

Wholesale Florists, 45 Lake St. (FLORIST EXCHANGE), CHICAGO, ILL.

We have over 100,000 feet of glass devoted exclusively to Roses. We have ten houses 21x170, containing nearly 20,000 plants of American Beauty. The balance planted to Albany, La France, Meteor, Bridesmaid, Bride, Perle, Mermet, Hoste, Victoria and Wootton. All shipments make from stock CUT FROM OUR OWN HOUSES, which assures our customers **Strictly Fresh Flowers.**

We ask for a trial order and we will do our best to make you our friends.

**FIRST-CLASS GOODS, STRICTLY FRESH, and at
REASONABLE PRICES GUARANTEED.**

THEY SAY That ASPARAGUS PLUMOSUS NANUS

at 50 cents a string, 8 to 12 feet in length, is the cheapest and best material for decorating, as it will stand longer and look better than any other green in this hot weather.
ORDER IN LARGE OR SMALL QUANTITIES, FROM

W. H. ELLIOTT, Brighton, Mass.

THE Boston Co-Operative Flower Growers ASSOCIATION

will remove their Wholesale Cut Flower Market to No. 1 Park Street, and will be all ready for business September 6, 1893.

The rapidly increasing demand for stalls, spaces and advertising space in the market makes it necessary for us to obtain larger quarters. This new market contains three times the floor space and is more centrally located than the present one.

There will be an auction sale of the preferences of stalls in the market Tuesday, Sept. 5, 1893, at 9:30 a. m.

ABSTRACT FROM BY-LAWS.

SEC. 3. Any grower who has on becoming a member of this corporation and subsequently establishes a store for the purpose of disposing of his products by retailing or otherwise in the city of Boston or having any connection or interest with any such store, shall be required to withdraw from the corporation.

Advertisers wishing to renew their contracts for the coming year can do so at once. Application for advertising space should be sent to

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DIXON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

The onion set crop in the vicinity of Chicago is estimated at from 40,000 to 45,000 bushels.

Mr. E. B. CLARK, of Milford, Conn., estimates his damage from recent severe storm at over \$1,000.

Mr. BRASLAN confirms earlier reports of short French crops of beet, radish and carrot seeds, the drouth having been very severe.

VISITED CHICAGO: Chas. P. Braslan (returning from Europe), W. H. Carson, with H. A. Dreer, Max Wilhelmi, of F. Barteldes & Co.

Mr. O'NEIL, the well known and genial representative of D. Landreth & Sons, reports good business during a recent trip of five weeks extending as far west as Salt Lake City. Mr. O'N. is devoted to the bicycle and finds it convenient in covering the generous distances about the World's Fair City.

Do YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Some of the Benefits of the Florists' Protective Association to the Retail Florist.

[Read by H. B. Beatty before the S. A. F. at St. Louis.]

Briefly the Florists' Protective Association is not only a direct benefit to every wholesale florist, but it is also a direct and positive benefit to every florist in the land. It has been said to me on several occasions by men engaged in the retail trade that they have in reality to pay the wholesale men for all the bad bills which they (the wholesale men) lose; and while I do not think that is so, at least in all cases, I will not take up your time in explaining in what way it is incorrect. But if it is so, as so many think, that you have those losses to pay, even in a greater or less degree, then would you not be willing to pay something each year to prevent that loss? The F. P. A. will prevent it, and do it effectually, if each member of the S. A. F. will only give it his support.

I am sorry to say there are many of you who know what it is to have a neighbor who is continually selling goods at less than living rates, thereby not only injuring your trade but the whole trade of your and adjacent cities; and in order to do this probably he is not paying his bills. Can you afford to allow such competition as this when you can so easily prevent it? The F. P. A. is after such dealers with a sharp stick.

We have also heard of cases where a party orders perishable goods shipped C. O. D., refuses to take them from the express company, but has a confederate who goes around to the express office, buys the flowers for the express charges and then turns them over to the store man who originally ordered them. Can you successfully compete with such parties? I think not. The F. P. A. can effectually prevent all such cases, and not only all such, but also prevent parties from running long accounts, selling the goods below cost to you and then going into bankruptcy, settling with their creditors and then repeating the same thing again at some future time.

In short the F. P. A., if given the proper support by the members of the Society of American Florists, will prove a balance wheel, which will enable all members of our craft to do a fair, pleasant business by compelling all poor pay, selling below cost men to get out, and stay out, of the trade. If that would not be a benefit, and a very great one, then I am no judge of business principles and effects.

Nowadays no man engaged in a whole-sale business thinks of getting along without some means of securing information in regard to the character, habits and financial standing of prospective customers, and to every one engaged in supplying the wants of florists we now offer as complete a medium for such information as any in the country, and at so low a cost that if a man did no more than one hundred dollars worth of business in a year he could well afford to belong to our association.

RICHMOND, INDIANA.

Mention the American Florist when writing to advertisers on this page.

PANSIES.

THE BEST ARE THE CHEAPEST.

SIZE is a strong point in Pansies; when you combine size, color, substance and form they are pretty near right. By careful hybridization and selection I have accomplished this, and the Pansies I send out this Fall will be an agreeable surprise, even to former customers. If you buy Pansies I would be pleased to correspond with you; they will be offered for sale from Aug. 20th to Dec. 1st, at 75c. per 100 or \$5 per 1000. Terms cash with order or C. O. D. No seed for sale.

Rochester, N. Y.

The return game of base ball between the Buffalo and Rochester florists took place here Tuesday afternoon and resulted in the score of 10 to 6 in favor of Rochester. That the teams are evenly matched is shown in the fact that the score at Buffalo was 9 to 6 against Rochester. Both were splendid games for amateurs. The stores closed at 1 p. m. and the green-houses at noon, so it was a holiday for all.

The following men composed the nines:

BUFFALO.	POSITION.	ROCHESTER.
M. Bloy	Pitcher	Chas. Vick
B. Scott	Catcher	Ed. Vick
— Krombrich	1st base	R. Bennett
E. Giddings	2d base	A. H. Salter

TO STOTT GARDEN IMPL'T CO., 136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Those Dear Children.

I always imagined that subjects of wailing and gnashing of teeth were not acceptable to our valuable journal, especially where they came from the lower five, but your comments on "working hand's" tale of woe greatly encouraged me to unfold a tale of woe of my own. It will likely be the only hint for a change of front that will receive attention and bring relief to many who are so unfortunately situated. One fact that all employers who board their hands want to bear in mind is that they do not board us for nothing, we pay for it in work, which is equivalent to cash, and that we want to enjoy our meals, if the quality and quantity will permit, and not be compelled to share the table with one or more illbehaved and in many instances dirty children. I can only wonder at the ignorance of parents who give a child the liberty of the earth, and who make foolish attempts to reason with one too young to be capable of reasoning.

Why don't I complain or leave some may ask. To complain, or even hint, to a mother that her child is not a sweet little darling is a pretty dangerous venture. Leave? What guarantee have I that it is not jumping out of the frying pan into the fire? P. D. G.

THE Florists' International Telegraph Delivery Association now has 58 members in 58 different cities, and its business the past year was very largely in excess of the year before.

Recent Legal Decisions.

Burden of Proof where Perishable Freight is Damaged.

When goods, though perishable or liable to rapidly deteriorate from internal causes, are damaged while in the hands of the carrier the burden of proof is upon him to show either that he was free from negligence or that, notwithstanding his negligence, the damage occurred without his fault; that is, that his negligence did not contribute to the damage. *Central R. & B. Co. v. Hasselkus*. Sup. Ct., Ga.

Right to Obstruct Flow of Surface Water.

An owner of land who builds an embankment thereon which obstructs the flow of surface water that falls and accumulates upon his neighbor's land does not become liable for the injury arising therefrom unless the passage way through which it flows is such as to constitute a water course. *Chicago, K. & N. Ry. Co. v. Steck*. Sup. Ct., Kan.

Mignonette as I Grow It.

In answer to several inquiries as to how I cultivate this now fashionable cut flower I will use the columns of our esteemed journal, the AMERICAN FLORIST, as a means of conveying my practice of growing it. In former years I would raise about 2,000 plants in as many 4-inch pots, partly for winter sale, and the greatest number of them for spring market sales, most of them being sold to dealers at an average price of \$1.20 per dozen. But since there has been a demand for good cut mignonette I grow a thousand less for pot sale, but four to five thousand more for cut flowers, and in pots at that, to one single solitary stem and flower.

In order to find the most convenient and profitable manner of raising mignonette for cutting I have tried several ways. One way is planting them on benches in four inches of good potting or even garden soil, and when grown into a bush, and before blooming, would disbud the different stems of the side shoots as they appeared. Another way is identical with the above, but the stems are deprived of their top bud, leaving the three upper side breaks to grow and bloom; thus each stem about twelve inches long forms a spray at the top six or eight inches long, making the whole stem about twenty inches, the entire plant bearing five to eight such stems. They sold at \$10 per hundred stems or sprays, but were not appreciated as much as those with one flower to a stem.

Another way, and the one now adopted here, is growing them altogether in pots, one plant in a 4-inch pot to single stem and flower. Grown in either of these different ways they will make large flowers, although the pot grown are a trifle smaller, but stem and foliage is harder and last longer after being cut. It may look absurd at first to give this weedy plant that much attention, but when a chrysanthemum (to one flower) can be grown and sold wholesale at \$8 per hundred I can not see why mignonette can not be raised that way as profitably when sold at such a price and grown in pots with less space and easier handling.

Since its introduction I have used no other than the now well known variety Machet. It grows a strong stem, dark green robust foliage, and above all a fine spike of florets, the whole spike when at its best from four to six inches above stem and very fragrant. For December blooming I sow the seed in August, in September for January and February, and by first of October for March and April blooming.

For sowing, a part of any ordinary bench in a partly open airy greenhouse is filled with three inches of soil. In this the seed is sown in drills, the drills two inches apart and one fourth inch deep. After

sowing it is carefully levelled off and watered with a fine sprinkler, so as not to wash the seed out of the soil. I shade the glass slightly by whitewashing. I prefer this sowing in benches in an airy greenhouse to sowing in frames outside, for though they will dry out sooner on benches there is less danger of damping off. Seed will be up in three to five days. Should some plants start to damp off I take a teaspoon and dig out at such place one or two spoonfuls of soil, along with the specks of fungoid growth developed there, and so remove the cause, thereby isolating and saving the other plants. The same method I practice in the cutting bench, which, when done in time, stops the further growth of fungus immediately, at least with all soft wooded cuttings.

After the mignonette is up and growing I thin out the plants to about a quarter or half inch. By this time the white moth makes its appearance, depositing its eggs underneath the leaves as it flies from one plant to another. Not many days after the tiny green worm will appear, feeding on and destroying the foliage and plant. To prevent them from doing harm I spray the plants once a week with a solution of one teaspoonful of paris green to about two gallons of water, well stirred. This will kill all the small worms while feeding before there is hardly any harm done. This syringing is kept up till late in the fall, when moths have disappeared.

When the plants are about one inch high they are taken up and potted into 2-inch pots and put on a bench in an airy house; watered freely the first time, but after that syringed sparingly but often. I cover the plants with paper for shade, as well as to keep too much air off for the first few days, but have the glass lightly shaded after the paper is left off. In about a week to ten days they are rooting and growing, when they are left to the full light. As long as there is no danger of frost I leave ventilators open day and night. When of suitable size, say three inches high and otherwise in fair proportion, I transplant into 4-inch pots, taking care not to break the ball of soil, else they will get a severe check in their growth. For this reason I give them a good watering the day before potting. When putting in the 4-inch pot (which is the final potting) I either mix in the soil chicken or pigeon manure, or, better still, put a layer of it about half an inch thick in the bottom of the pot.

When plants are growing up and need support each plant is taken in hand again, given a stick fifteen inches long and then tied once. After a month or six weeks they will be long enough to be tied once more, by which time they will have made side growths, which are removed at the same time, and later on when near blooming the last side growth is removed again. The pots during all this time are standing quite close together.

During winter the temperature is kept low, say 40° to 45° at night, and ten to fifteen degrees higher in the day time. The mignonette I had on benches were also grown in 2-inch pots and afterwards planted one foot apart, but they were pinched back once, so as to form a bushy plant. In order to grow straight stems I put four sticks around each plant and draw a string around them to keep up the branches. These are about all the essential points in my treatment of mignonette, and it will not be amiss for anyone interested in its culture to try this method.

A. MEYER.

St. Louis.

Vases.

It will be recollected that early in the season we published engravings from photographs of vases, etc., as they appeared just after being filled by Mr. Wm. Scott, of Buffalo, and promised pictures of the same again after the plants had made a good growth. We now redeem our promise and present in this issue views of three of the vases from photographs by E. L. Cafish, of Buffalo. Views of the hanging baskets, window boxes, etc. will appear in subsequent issues. Mr. Scott's descriptions of these vases follow.

The rustic vase illustrated is 2 feet 9 inches high and 2 feet square. These are largely used in Buffalo cemeteries and give great satisfaction, the plants doing rather better in them than in iron vases. As the plants used in each of the vases are much the same, with only slight variation, I will give the whole list at the end of these notes.

The wire basket was 2 feet 6 inches in height, 3 feet long and 1 foot 4 inches wide. This basket costs about the same as a rustic wooden basket and has the same advantage in low first cost, also the same disadvantage in that its life is only 3 to 4 years. A further objection is, there being only a thin layer of green moss between the soil and wire frame, evaporation is very rapid and lots of water is needed.

The cast iron reservoir vase, such as illustrated, is in more general use than any other style. The size of the one shown is, height 3 feet, diameter 2 feet.

The drooping plants growing in the vases illustrated were: *Nierembergia gracilis*, *senecio*, money vine, *vinca*—variegated and plain green, *abutilon*, *Lobelia gracilis* and *erinus speciosa*, *nasturtium*, *lophospermum*, *Solanum jasminoides grandiflora*, variegated *glechoma*, ivy geranium.

The upright plants were: *Dracena indivisa*, *Crozy canna*, *Nephrolepis tuberosum* (much better than *exaltata* for this purpose), *Anthemis coronaria*, several varieties of flowering geraniums (all double), Mt. of Snow and bronze geraniums, *Rose of Castile* and *Black Prince fuchsias*, *anthericum*, three or four of the most distinct colored *coleus* (none better than old *Verschaffeltii*, *Black Hero* and *Golden Bedder*), *rex begonias*, tuberous rooted *begonias* and *achyranthes* in variety.

Notes on Propagation.

In order to keep up an assortment of sizes of decorative plants it is necessary to continue propagating in such quantities as one's trade requires at all seasons of the year, but it is well to remember that the summer is the most favorable time for many operations of this character from the fact that it is the active

growing season for a majority of the plants in general use as decorative stock.

Of course it is desirable to have a house set apart for this purpose, but if limited space will not permit of this arrangement then the next best plan must be substituted, that is, the enclosure of a certain space in one of the houses by means of frames, so that the proper conditions may be secured for successful work. For general use in the propagating bed some clean sharp sand has long been the favorite material, as is well known by every florist, but for many warm house plants, such as *crotons*, *dracenas*, *pandanus*, *ficus* and others there is no better medium than *cocoa fibre* refuse, either for planting the cuttings in or to plunge the pots within the frame, this material retaining moisture for a long time without becoming sodden and also promoting rapid root growth.

The various palm seeds of trade varieties are also received in most instances during the summer months, and in all cases should be given prompt attention, almost any light soil answering for the seed pans or boxes, and the old fashioned rule for sowing seeds of covering them with soil to a little more depth than the diameter of the seed will usually prove satisfactory for seeds of this class. Abundant drainage should be given to the pots or boxes, for stagnant moisture generally results in failure in palm growing, and this fact should never be lost sight of from the seedling stage up. The common practice in many establishments has been to sow palm seeds in about six inch pots, though shallow pans and boxes are also used to a greater or less extent and with some saving in space, but where very large quantities are sown they are sometimes planted out on side benches where abundant bottom heat can be given, the latter method having been in use for a number of years in some of the large European establishments.

If wooden boxes are used it is advisable to give them a good coat of whitewash both inside and out before using and the addition of a small quantity of carbolic acid to the whitewash will be a further preventive of fungoid growth. Strong bottom heat will give much quicker results in the germination of palm seeds, but I have been unable to prove that soaking the seeds in warm water for twenty-four to forty-eight hours before planting has resulted in any quicker growth, though this method has at times been recommended. The period of germination varies greatly with different species, probably the quickest to start into growth being *Latania borbonica*, the germ of which frequently protrudes through the shell in from ten days to two weeks from the time of planting, while the seeds of some of the *attaleas* have been known to remain dormant in the ground for five to eight years before making any apparent growth. It is, however, almost needless to remark that palms with the latter characteristic are not likely to become trade plants, and are seldom met with outside of private collections or botanical gardens.

Kentias also are somewhat slow, usually requiring from three months upward for their germination, but if the seeds are fresh and the conditions favorable the result should be from fifty to seventy-five per cent of the number of seeds sown in the crop of plants to be potted off. But unfortunately all the seeds sent to market are not fresh and failures frequently occur, so that the result noted above cannot always be counted on.

Dracena canes of the trade varieties,

as *D. terminalis*, *D. terminalis stricta*, *D. ferrea* and *D. fragrans* are also offered at this time and should be planted at once, the common method being to lay them on a well heated bench in the propagating house, said bench being filled to a depth of three or four inches with a mixture of sphagnum and sand and the canes almost buried in this material. Some trouble has been experienced in some instances from the fact of the stock plants of *dracenas* becoming infested with one of the many fungoid diseases, this making its appearance in the form of the so-called "spot," and where this prevails in any great degree it is wiser to discard the young stock at once, as but a small percentage of the affected plants will out-grow the disease sufficiently to become saleable specimens.

But, providing this difficulty is not encountered, the canes will soon start into growth from nearly every joint, and the young plants should be cut away as soon as they have made a few roots.

The topping of *ficus* has frequently been described in the *FLORIST*, and we need only remark that the most symmetrical plants are secured by this method, and that the operation is a rapid one during warm weather, and while it may be continued at all seasons of the year in a warm house, yet the present is a good time, and useful little plants may still be secured in time for this winter's sales.

W. H. TAPLIN.

Seasonable Hints.

The great bulk of the carnation plants distributed are sold in the form of cuttings during the winter and spring months. This is the cheapest and best way to obtain stock. But there is also quite a large trade done in the fall in field grown plants. If properly packed they can be shipped long distances by express, but it is not safe to send them very far by freight, because of the danger of delay. The concession recently obtained from the express companies, whereby plants are received at general special rates will stimulate the sale not only of carnations but all other plants as well. In packing there are several points to bear in mind. The packages must be as slight as strength will allow, the roots must be kept moist, and there should be no danger of the plants heating in transit. To follow these requirements is a simple matter, needing only care and forethought on the part of the person in charge.

The plants are dug as we would for planting indoors, but the soil is more carefully shaken from the roots. The roots are dipped in water and dry soil shaken over them. Unless the plants are small this had better be done one or two at a time. They can be packed in the boxes in two ways. The quickest for large lots is to have the boxes—crates are better if strong enough—as deep as the plants are tall. Cover the bottom with a good layer of damp sphagnum, not too wet. Incline the box and commence at the lower end running a row of plants across, then place a layer of sphagnum against the roots and so on alternately until the box is full. They should be

RUSTIC VASE

pressed together as tightly as they will bear, being careful not to break the stems, for they are very brittle. Proper care must be taken to separate each variety and to label them correctly and legibly. Slat is then nailed across the top of the box, for if open double express rates will be charged.

It is handier to pack small lots in paper, using plenty of moss about the roots and rolling them in bundles, several plants together, as with other plants. The bundles can be packed flat in a box, but not in too large bulk, as the plants would be liable to heat.

When large plants like these are received by the purchaser the boxes should be well watered before being unpacked. When planted they should be shaded longer than plants just removed from the ground. The weight of carnations thus packed will vary according to size. Small lots will weigh more in proportion—about one half to three quarters of a pound per plant. In large lots they will weigh packed from twenty-five to forty pounds to the hundred. W. R. SHELMIRE.

Avondale, Pa.

Chester County Carnation Society.

The regular meeting for August was held at "The Patch," the comfortable home of President Ladley. Your correspondent unfortunately was obliged to

be away on that day and missed the very pleasant afternoon, which was spent mostly out of doors.

The subject of oil for fuel was continued, and Isaac Larkin reported further experimentation with oil burners, but with no favorable results.

Jos. Phillips spoke of the favorable results in a dry season from irrigation. Deep and shallow culture was discussed with verdict in favor of two to three inches depth.

The regular meeting for September was held at the society's room, September 2. Mr. Darlington spoke of the good results from crimson clover to plow under, and approved of the use of domestic grown seed. Seed sown October first will be tall enough to plow under by the middle of November.

Mr. Shelmire gave his experience with carnations for bloom in a violet house with the glass removed. The growth was not as strong as plants set out in the field.

Wm. Swayne had some Tidal Wave plants carried in 3 inch pots until July 1 and then set in solid beds in a cool house that have made a strong growth. Buttercup and Golden Triumph treated in the same way are stronger than plants of same age and variety set out of doors.

The potting of varieties most difficult to lift was recommended, to be done two weeks or more in advance of time for

benching. Pride of Kennett and Anna Webb had been tried to advantage. Mr. Styer thought the extra work was unnecessary where ventilation was sufficient. He had planted a house August 1 with excellent result. He uses plant-cloth tacked to under side of sash bars, by which means he keeps houses much cooler.

Edward Swayne showed an attachment for a hand cultivator to follow the harrow teeth and level and pulverize the ground—made of heavy galvanized wire set three fourths of an inch apart in a head or frame as wide as will cover the space between two rows.

Mr. Darlington spoke of the successful use of whale oil soap to destroy the black aster beetle, one ounce to three gallons of water.

The Chester County Carnation Society at all times extends a cordial invitation to the fraternity to visit them; the meetings are held on the first Saturday of each month, usually in the Boro' of Kennett Square. The membership, with one or two exceptions, embraces all the growers of the county, whether commercial or amateur, and includes a few outside. Questions of general interest are talked over somewhat informally, carnation culture of course being the principal topic.

C. J. P.

Fresh Information Regarding Sweet Peas.

ED. AM. FLORIST:—Quite a batch of valuable notes have collected in my hand and they will perhaps be appreciated by your florist subscribers. At the London horticultural exhibit this summer Mr. Eckford showed nine new varieties of sweet peas in addition to the twelve novelties introduced last season. The nine are as follows: Blanche Burpee, a very large white seeded white; The Belle, Eliza Eckford and Duchess of York, three that the introducer pronounces grand; Countess of Aberdeen, a large very pale pink; Novelty, a very large red with orange tinted standard; Excelsior, scarlet; Mrs. Chamberlain, large, red striped; Meteor, bright orange salmon standard with light pink wings. This seems like a rapid addition of varieties, but it represents the fruit of long years of patient work. This will make fifty-one Eckfords. How may we judge of their merit?

Two years ago six novelties were offered, viz.: Dorothy Tennant, Her Majesty, Mrs. Eckford, Ignea, Lemon Queen and Waverly. The writer has had them again this year in perfect bloom, and the first three are magnificent and all have merit. Again the twelve novelties offered last year have been tried here. The writer had eleven of them in perfect bloom, and all of them were on exhibit at Springfield. I will name them in the order of their merit: Venus, Lady Penzance, Lady Beaconsfield, Firefly, Blushing Beauty, Emily Eckford, Peach Blossom, Ovid, Gaiety, Duke of Clarence, Stanley and Royal Robe. The first six are of great merit and all are worthy of their originator. These were all described in the AMERICAN FLORIST of February 9 last. It is safe to assume that the novelties just shown in London will have as large a percentage of extra fine ones among them as these we have tried in this country.

Now it is somewhat tantalizing to call attention to these highly cultured varieties. Only a small number of the expensive sealed packets find their way to this country the first year. And the serious question is going to be whether, by the time they are grown in sufficient quan-

tity, they will hold the grand size they show when fresh from the originator's hands. Much of their merit will be gone if by field culture they fall back to the old size and form. It is to be hoped that in every locality there will be enthusiasts who will make an exhibition flower of the sweet pea, and give everybody a taste of them at their best. With probably two hundred acres of this flower grown for seed this year in this country it is plain that the commoner varieties must be made a field crop to meet the demand; but the Eckfords that for the past five years have been taking on such size and expanded form are going to demand a class of growers who will cater to those who are willing to pay for them.

Let me say to those who wish to import the expensive seed direct from England that it is of low germinating power the first year and should be started in the house. If one-third of it germinates, even with careful treatment, it may be considered a good percentage.

An English seedsman tells me that the varieties *Carmen Sylva* and *Rising Sun*, brought out by Laxton, are developments from the *Vesuvius* stock and not specially remarkable. He saw the *Emily Henderson* growing in Germany and his testimony agrees with my experience with it this summer, that it is a white of remarkable substance and size and has what he calls the "paper" whiteness. I commend it as the second American variety of real merit.

Let me speak again of the *Lottie Eckford*. Mr. Eckford tells me he did bring out such a variety, and describes it as a "creamy white with blue edge." But it appears to have been lost in the Butterfly. An English house still sends out what they call *Blue Edged*, but on trial that does not hold distinct from the Butterfly. Our seedsman have been misled into calling the *Capt. Clarke* the *Lottie Eckford* by some German house. There isn't a seed of true *Lottie Eckford* in this country, and for the present at least the variety is probably lost. Mr. Eckford does not list it. W. T. HUTCHINS.

Indian Orchard, Mass.

The World's Fair.

This is a midway season, and there is no very great difference in the blooming material week by week. The phloxes are still holding their own on the Island; pity there is not a greater mass in bloom, and the sunflowers are very brilliant. But the drouth is very severe, and trees are suffering as well as everything else. It must be said however, that almost everywhere on the grounds the turf is kept in splendid order, not a very easy matter, considering its recent origin, and the trying weather. The grass surrounding the canna beds is especially good. The cannas themselves increase in beauty every week and the show of bloom is most striking.

There is a liberal show of bloom in the little plot near the department green-houses, called the "old-fashioned garden," which forms part of the New York state display. Marigolds, sunflowers, stocks, balsams, four o'clocks, pansies, and other familiar old flowers, all in a tangle of luxuriant growth. The home-like familiarity of this garden is commented on by many admirers.

A number of the chrysanthemums, some planted in boxes, and others in heavy willow baskets, are now standing outside; they look very robust. The remainder of the chrysanthemums is inside. All these plants look well, and we may hope for a good show of bloom before the Fair closes.

The tuberous begonias in the New York display have grown out of disease now, and are flowering freely, showing many magnificent blooms. They are extremely showy, particularly the yellows, salmon and light scarlets. The roses in the little rose house are blooming very freely. Mrs. W. C. Whitney is a mass of pink flowers, and the house is filled with its fragrance. *Kaiserin Augusta Victoria* is also flowering very freely, and the same may also be said of *Senator McNaughton* and *Mme. Caroline Testout*.

The nymphæas, both in the inner court and the basin in front of the Horticultural Building, are not just now showing very much bloom. The Egyptian lotus seems to be doing but indifferently, which is a pity, for it would make a great impression blooming with its accustomed luxuriance in such conspicuous places.

In the southwest corner of the dome in the Horticultural Building, there is a group of araucarias from *Pitcher & Manda*, which, perhaps, hardly attracts as much notice as it deserves. It includes very unusual varieties of great beauty, as well as familiar ones. Among them is *A. Cunninghami glauca*, similar in form and habit to the type, but with bluish tinted foliage. *A. Rulei glauca* is a striking variety, somewhat suggestive of *A. imbricata* in habit, but with leaves less sharply pointed. *A. Rulei viridis* was another form, with very rich green foliage. The type is a native of the Papuan Archipelago. *A. brasiliensis* and the familiar *A. excelsa* were both to be seen in good form. Two forms of *A. robusta* were especially stately and beautiful. One was *A. robusta viridis* *Vervatli*, this is very beautiful in both form and color; the other, *A. robusta Niepraski elegans*, slender and graceful in growth. *A. Cunninghami viridis* was noticeable for its rich green color.

Behind these araucarias is a group of cycads. *Zamia Roezlii* and *Z. Lehmani* are shown as good sized specimens, and there are some fine macrozamas, among them a fine *M. spiralis*, and *M. Mackenzii*. *Encephalartos horridus* looks quite formidable enough to justify its name. *E. pungens glauca* and *E. Altensteinii* are both good specimens and the group is completed by cycases and dions. The group gives an opportunity for comparison of the various cycads, and is in harmony with the araucarias in front of them.

World's Fair Impressions.

I have been there, and should be sorry to have missed it. I was disappointed in some things, or rather in not finding some things we are badly in want of, and which, after leading such a retired life as I have done for several years, I expected to find there.

I did not expect to find the plants blooming all the year round, which the ladies always inquire for; what I was in hopes of finding was something in the way of hardy shrubs, trees and herbaceous plants to fill the place of spring and early summer stuff in the hardy garden. Hardy hydrangeas and a few colors in altheas have been our stronghold in shrubs for a long time; without these there is little among shrubs in bloom at this season. Herbaceous phlox were seen in fine showy varieties, but the improvement in them is not very marked since I was a little boy.

Tritonia uvaria in large clumps would have a very striking and pleasing effect at the edge of the lakes and lagoons, but the grumbling public should remember such clumps are not made in one year, and I question very much if they would stand

the climate at Chicago such winters as the last.

I certainly expected something more from our nurserymen in the way of summer and fall blooming hardy stuff, but I did not see it. I met no better sweep in looking through the European exhibits of hardy plants, which at least did not show to any better advantage, and some things shown are about as useful in this climate as a last year's bird nest.

Visitors who were fortunate enough to be at the Fair while azaleas were in bloom inside and rhododendrons and hardy azaleas outside are now disappointed because they do not see the same blaze of color at this season. I, who have put in about ten years of my life about the London shows and the garden of the world for rhododendrons and that class of plants, parts of Berkshire and Surrey, England, naturally can tell what effect such plants have, and I know they do not bloom the year round. If they did we would tire of them, but I should like to see something to take their place later in the season. I did not see it at the Fair, nothing really to relieve the monotonous green and brown of the shrubbery but the *Hydrangea paniculata grandiflora*, which is one of the grandest hardy plants in cultivation, and the man who will introduce something equally good and easily grown and of a brighter color, would be entitled to a monument of more lasting material than the statues at the World's Fair.

I am not growling because that flowering stuff is not there; the general public growl about that; I am only growling, if it can be called growling, because such stuff as is wanted for the purpose is not in existence, even in catalogues.

Some of the public are complaining because they don't see the twelve apostles made of echeverias. I saw a bed of crotons in front of the Pennsylvania Building that excelled anything in the mosaic line. Some of them think they ought to see Columbus and his crew made of alternanthera; instead of that I saw superb beds of cannas, which are deservedly coming to the front.

In addition to what I saw outside I saw inside what I consider a masterpiece of arrangement in the large dome, which I consider as near perfect as could be done in the time, when taking into consideration the height of the place. The tallest plants in cultivation would be mushrooms in it. I have seen such places as the palm houses at Chatsworth and Kew in England, where grand plants can be seen, but they would be dwarfed in such a place as the dome of the Horticultural Building, Jackson Park. Then the public should take into consideration the fact that the buildings above named have taken more than a life time to bring them to the state of perfection they are now in, while at Jackson Park it was for temporary and immediate effect, which I think is grand. Then some people say of the climbing vines, "That common thing," which means the despised old *Cobæa scandens*. What could be found to give the effect in such a short time? Suppose such plants had been used as the best varieties of strong growing *passifloras*, *tacsonias*, *allamandas*, *Thunbergia Harrisii* and several other grand old things for climbers in hothouses. By the time the ground was warm enough for them to commence rooting for a strong growth the season would be over and the vines a dead failure. Most likely if the same thing was to be done over again many changes would be made in planting the mound, but taking all things into consideration I think it a great success.

WIRE BASKET OR STAND.

As your valuable space will be much taken up with aftermath of conventions, congresses and other seasonable matter I will say no more about what I saw further than to say I saw John Thorpe, and was never better pleased to shake hands with anyone in my life than I was with Uncle John in his natural element.

Detroit.

S. TAPLIN.

The American Rose Society.

It will be the source of much gratification to all horticulturists to know that an American Rose Society has been organized.

The idea of adding the secretaries of the Carnation, Chrysanthemum and Rose Societies to the committee on nomenclature of the S. A. F. is an excellent one. Though the nomenclature in the Rose Society will not require so much watchfulness as it does in the other two societies—at present, at least. There is no telling what it may be when rose seedlings are raised by the acre in California and other favored parts of the country.

Perhaps it would not be out of place for the society to undertake to abbreviate some of the names which many roses receive, notably those sent out by European florists; especially does this apply to the names given by the rosarians of France. Nor are the craft very far behind in this respect in Germany. That sterling rose Kaiserin Augusta Victoria is a case in point. Active Americans will not take time to give the full name when

speaking about this promising white rose—and they are talking about it very often in these days. Its value as a summer rose cannot be questioned, as it is proving itself to be away up in the front rank for that purpose this season. I mean as grown under glass, as I have not seen it tried outdoors so far. Whether it will prove to be profitable for winter rose remains to be seen. It is very frequently referred to as "Kaiserin,"—with a diversity of pronunciations! Sometimes it is called Augusta Victoria and again simply "Victoria." Would it not be well for the Rose Society to offer some advice on this point, or take some action? "Augusta" was at one time given to the old Solfaterre, and sent out as a new variety. This was many years ago. It is rarely or never called by that name nowadays. To be known as only Victoria, would lead some people to think that it was an English raised variety, and named after Queen Victoria!

There is another variety of German origin, which has for its prefix Kaiserin—"Kaiserin Friedrich," and if this should prove to be a popular and valuable variety, it would hardly do to call either of them only *Kaiserin*, as it might cause some confusion. The latter variety is said to be a cross between Gloire de Dijon and Perle des Jardins. This is an excellent combination, and may prove useful, but whether for cut flower or not can only be determined by a thorough trial. The Rose Society can help us greatly in the matter of nomenclature.

E. L.

Miscellaneous Seasonable Hints.

Tulips and narcissus will now be arriving, and if you have the chance get them boxed at once. What you want for outside planting or for sales can be put aside, for there are a good many weeks yet to spare for that, but those you want to force should be planted in the flats as soon as possible. There is nothing gained by delay. If started at once they will be rooted before very severe weather comes, and then forcing them into flower is an easy matter. I have more than once in these pages given the dimensions of the flat that I believe is the most convenient size, and they should be all alike for every kind of bulb you force. The size is twenty-four inches long, twelve inches broad and three inches deep inside measure, the end piece one inch thick, sides and bottom one-half inch. You can make this box on your own place, and labor, lumber and all won't cost more than six cents each. You don't have to use a fine compost for the tulips, Von Sion, etc. Any old rose or carnation soil is amply good enough if it is in the right condition. I place the flats out of doors on a dry piece of ground in beds six feet wide, and a space of five or six feet between the beds. Put some old strips of boards under the boxes. They lift up much cleaner and better than they would if placed on the ground. Thoroughly soak the flats before covering; this is of great importance. I have seen some people trust to "fall rains"; let the hose be the first fall rain, and a good one. If we have an occasional good rain no more watering will be needed, but if we get a long dry spell, as we sometimes do in the fall, give the beds a good wetting every two weeks. After the soaking has gone well down I put on a very thin covering of buckwheat husks, or a very slight covering of straw; this makes the earth covering break away nicely from the soil in the flats when you are bringing them in to force. After that (the straw) throw up the soil from between the beds till the bulbs are covered to a depth of from two to three inches and not more; the excavation you have made digging out the soil affords fine drainage for the beds. Nothing more can be done, except the watering, till winter comes in earnest. For the last covering I prefer to let the earth on the beds be frozen an inch or so, and then throw on your covering of long stable manure; from four to six inches is enough. The snow will do the rest. If in a colder latitude than this perhaps more covering of manure is necessary. It does not hurt Von Sion, or any of the tulips or Dutch hyacinths, in the least to be frozen hard, but I have noticed that when frozen much they take several days longer before coming into flower. Don't forget that paper white narcissus don't want any frost at all at any time of their existence.

As you will be lifting the violets about the end of the month, go over them carefully now and cut off all runners; one fine crown is all you want at lifting time.

If you want a batch of Bermuda lilies early, bring in some and start them young, slowly increase the temperature as the plants increase in size.

You ought to be very busy propagating a great variety of stuff just now. The ivy geranium is an important plant with us now. Put in the cuttings at once in sand. Two other plants indispensable as droopers are vinca and Abutilon vexillarium. Some lift old plants of these; to have a few old plants is useful, but where you want several thousand of each so many would occupy too much room for

many months. I propagate them the middle of this month. The abutilon requires a little more care than many other things. To be entirely successful with it take only the tenderest end shoots, and as they wilt badly if neglected be sure and keep them well shaded and watered. As the vinca and abutilon require just about the same handling, I will say after being potted from the cutting bench they are kept in 2-inch pots until the middle of February, when their top is pinched off and they are shifted into 3 or 3½-inch pots. They can be stood along the edge of a rose or carnation bench, and will make fine young stuff by the first of June, plenty large enough.

There is a small, insignificant weed (I am almost ashamed to write about it, yet you see it in some very grand catalogues) that is used largely by us; it is the little money vine, *lysichachia*. With all its insignificance, I remember the time when I did not know how to manage to have a nice lot of young plants of it in the spring. Take a lot of the healthy shoots now, put three cuttings in a 2-inch pot, keep them shaded and watered; in a few days they will be rooted. Keep them in a cold frame covered with sash all winter till 1st of April, then bring them in, and after they start to grow shift into 3-inch and you will have useful plants for baskets, etc. If you keep them in the greenhouse all winter they get a rust and are useless. Another weed, the variegated *glechoma*, a very useful drooping plant, should be treated precisely as the money vine.

Don't let your coal bin be empty just now; some nights in the near future your young roses and old ones too if you have any, will want the chill taken off them. Experienced rose growers know all about that dreaded fungus which is produced by a cool night and close temperature. If it is impossible for you to fire up a little on cold nights then *don't shut up* your house; leave on a good bit of ventilation, even if the temperature should go down to 40° outside. It is not the low temperature that produces that leaf drooping fungus, but a close damp atmosphere, so leave on plenty of air if you can't fire up a little.

WM. SCOTT.

Buffalo, N. Y.

New York.

"The worst week we have ever had," is the average report from all the large establishments in the city. This has been the story all summer, but each week seems to outstrip the last in dullness. The florist's stores are practically deserted. Many have been making improvements during the summer months. Warendorf's is all finished and ready for business, so is Hanft's. Fleishman's new store under the Hoffman House is now beginning to show how beautiful it will be. The decorations on the walls and especially the frieze are very handsome. Scallen's store is all pulled to pieces, and when refurnished and decorated will be as good as new. Mr. Scallen is more interested in a new horse than the flower business just now, "so they say."

The wholesale dealers find but little to do, many of the generous ones have devoted the rear of their store to the accommodation of the "Greeks" who find the same dullness on the street that prevails in the stores and so employ their time in testing their luck at that highly respectable game known as "hoss and hoss." The dullness in the wholesale and in the 34th street market is still further emphasized by the absence of His Honor Mr. Johnnie

Wier, who is taking a vacation for nearly the first time in his life, and has gone with his family to see the World's Fair. He is greatly missed.

The windows of the various flower establishments are not very attractive as but little effort is being made to make any display. In the window of a leading establishment on one of the finest streets is to be seen a fine group of *araucarias*, nice plants but disfigured by the weeds growing in the pots, the weeds being in some cases larger than the plants themselves, and the pots are quite thickly covered with slime. They say that "the less a man has to do the less he will do," and flower clerks are not an exception to the rule, for in this case while the plants were to be seen in such shape in the window, the clerks in the rear of the store were doing their best to kill time. The grower should not have brought plants to the city in such shape, anyway.

The firm of Hunter and Purdy have dissolved, Mr. Purdy retiring and Mr. Hunter continuing the business under the name of Frank D. Hunter. Mr. Purdy has not yet decided as to his future movements.

Over at Flatbush there are indications of a revival. Mr. Meissner is home from the Catskills and very much improved in health. Mr. Kretschmar and Mr. Bergman have just returned from Europe greatly benefited by their trip, and ready to do their share towards making the horticultural superiority of the Flatbush florists sure for the coming season. It is said that *cyclamens* at Flatbush are likely to break the record this year if good intentions and determination on the part of the growers amount to anything.

Julius Roehrs, another of the European absentees, has also just returned with his family to Carlton, N. J.

Madison, N. J. still keeps up as the leading rose growing centre from appearances over there at present. Fenton has built three new houses this year, and Francis and others have all made improvements more or less in their establishments. Francis will make *mignonette* one of his leading specialties again this year. The house for the *mignonette* is 350x30. The young plants are in good shape excepting where the wood louse has got in its work on them. He is a great deal of trouble and the only way to save the plants is to cover each one with a wire netting. J. Murphy has the reputation of growing some of the best *Merrets* and *Brides* that come from Madison.

A peculiar thing of the Madison florists is their sociability. You call on number one, who immediately leaves his work and escorts you to see number two, who immediately joins and assists number one in escorting you to see number three, who does likewise, thus increasing the crowd as you go along to number four, and by the time you get around your trip you will have a small army.

At Summit, J. N. May has been making very extensive alterations and additions to his establishment. While the work is not fully completed yet it is far enough along to show that when finished it will be one of the finest establishments on the continent. A large steam boiler has been put in and about 600 running feet of houses have been added. The young roses appear to be in splendid condition.

The French *cannas* at Short Hills are very fine just now. Mr. Manda regards the new Charles Henderson as the finest one of the season. Late planted *auratum* lilies are making a great show here. They will be in bloom continuously until November.

Philadelphia.

The recent disastrous storms visited our city in part, causing considerable damage to trees and large vines, such as *ampelopsis*, *wistarias*, etc., which were torn from trellises and walls. As far as we can hear however none of the trade suffered to any great extent, the amount of damage being the loss here and there of a ventilator, and the blowing out of loose panes of glass. It is really wonderful, the amount of wind the ordinary greenhouse structures will stand. Large trees will be uprooted or great branches broken off while the light glass roofs of greenhouses on the same place will escape the fury of the storm uninjured. It is said that if secure, the ventilators should always be raised a short distance during a severe wind storm, there not being as much strain on the roof, when the air can escape from the house as when it is confined.

Business, while very light indeed, is still quite good for the season, and as the September days increase in number we hope and feel sure that the sunbrowned faces of the flower buying public already appearing, will become more and more conspicuous on our streets, and also hope that the early fall weddings may set in quite prematurely. The growers say their stock has never looked finer, the palm men claiming to have their plants in better shape and in larger variety than ever before. The retail men have renovated and touched up their stores generally, and are only waiting for the faintest suspicion of a revival of trade to lay in a stock and begin the season in earnest.

Prices of all kinds of cutflowers remain about the same. With the cool evenings the quality of roses seems to be improving. Sweet peas are done and asters are on the wane, they have been unusually good this season. Tuberoses are commencing to be seen and before long will be found on the street corners by the bucket full. *Gladiolus* are a drug and are offered, fine spikes, two for five cents; there is no money for either the grower or the dealer at this price, and it is a question whether any more are sold at the reduced figure than at the old one of five cents for one or six for twenty-five.

In the La Roche & Stahl matter there is nothing new. The bank creditors seem to think it will be better not to sacrifice or force to a sale immediately the equity in the real estate, but to wait awhile until the financial flurry is over, and beginning probably next spring, select a few choice lots to be put up and sold and in this way try and get as much as possible out of the property. The personal property was sold under the judgment held by the trustee and not by any one person, and was purchased by Mr. Hebenner, vice-president of the Market street National Bank, not for the bank however, as was at first supposed but for his own personal benefit. As his purchase included all the stock at the greenhouses as well as the stock, good will, fixtures, and lease of the store, he has jumped at one bound into the positions of grower and dealer, and only lacks the necessary experience to make him a full fledged member of the craft.

Rodman Eisenhart is first in with single violets; they are very fragrant but look better in the basket with the lid on than they do on the counter. Rod had better let them hide their modest heads for awhile longer.

A picked team under the guidance of Isaac Kennedy tried to show how they would have brought that cup back in a game with the team which represented

CAST IRON RESERVOIR VASE

the club in the match at St. Louis. But they did not even make a respectable showing as they were defeated in both matches, the last time by over 400 pins, so that Captain Anderson's men will now have a rest. K.

Baltimore.

The long drought is broken at last and we have green grass and full tanks again. The rain came too late for the asters, which, thanks to the beetle and heat, are very, very scarce.

A good illustration of the value of scientific nomenclature was furnished at the last meeting of the club by a discussion about this same beetle. A question from the question box was: "How to protect asters from the beetle?" One member said as it was a shy bug the best plan was to plant, if possible, where people passed frequently close to the asters; when this was not practicable the preparation of paris green used for potato bugs would do equally well for this, as it was the old original potato bug with which he was acquainted long before the Colorado beetle made its appearance. Thereupon another member said the question had nothing to do with potato bugs, which were soft, yellow, worm-like creatures, but a beetle which preyed upon asters and several other plants, and which

was about an inch long and of a slate color or jet black, even intimating that the first member had lost his bearings on the question altogether, to which of course the first, being perfectly sure of the two beetles, made reply, and the profitable considering of ways and means to destroy the pest degenerated into a dispute about identity, which would all have been impossible had any one been able to give the name of either the Colorado beetle, or the long black one, or both.

The dahlias have suffered as well as the asters, but there is time yet to get a fair bloom from them: so far they are scarce and poor.

Everybody seems to be trying to get up more glass this year, so we may hope to be in a measure independent of other cities for our flowers next winter, if nothing happens. A list of the florists who have put up more glass this summer would include a heavy majority of those in the business.

The returned delegates to the convention seem to find it hard to express their pleasure, and the satisfaction they derived from the excursion and convention seems to have exceeded their most sanguine expectation. There seems to be only one fault to find with them, and that is that they did not get the S. A. F. for next year.

Never mind, we will get it here yet, and that pretty soon. MACK.

St. Louis.

Trade continues to improve slightly as the season advances and the home comers continue to increase. The convention of Sunday School workers during the past week has been given credit for livening things up a bit. Stock coming in is about the same as the average during the summer, but the cool nights now prevailing are expected to improve indoor flowers. Preparations are being made all around for firing, the thermometer having gone as low as 52° during the past week.

The chrysanthemums grown for cut flowers at the various places noted lately are in fine shape, and the contests at the fall show in these classes promises to be spirited. Mr. John Young and family have returned from Atlantic City, where they have spent several weeks, all looking very well and expressing themselves as having had a pleasant time. R. F. T.

The "Model Farm," Philadelphia.

The model farm at Point Breeze, owned by Mr. Kingsley, of the Continental Hotel, is notable as being one of the first places in this neighborhood where mushroom growing was successfully carried on on a large scale. The late Mr. Kingsley, senior, was an enthusiast on the subject and not only grew enough for his big hotel, but shipped large quantities to New York and elsewhere besides. It is a good many years now since they first began growing mushrooms at the model farm (over twenty), and they are still producing them in large quantities.

Mr. McCaffrey, the late superintendent at the model farm, earned quite a reputation as a successful grower of mushrooms, and since he left Mr. Kingsley, five or six years ago, to start in the business on his own account at Moorestown, New Jersey, he has done well. He grows the mushrooms under the benches in his greenhouses, using the benches for radishes, lettuces, beets, cucumbers, tomatoes and other vegetables.

Mr. James Smith, the present superintendent at the model farm, has also had good luck with mushroom growing as well as with most other crops raised on the place. On the occasion of a recent visit there by the writer the spick and span condition of the horses, cows and other stock, the well tilled fields, the flourishing crops and the absence of weeds were a pleasure to see and spoke volumes for Mr. Smith's ability and industry. Mr. Kingsley has got a "model" farm indeed, and a "model" manager, too, for that matter.

Mr. Smith informed the writer that his son Archibald, who has ably assisted his father for some years, takes charge of the model farm on the 1st of August. Mr. Smith himself having been appointed superintendent of the Betz estate at Betzwood, four miles above Morristown, this state. The Betz estate comprises about 1,700 acres in the highest state of cultivation. All kinds of truck is raised and the greenhouses are new and very complete. Mr. Betz is to be congratulated on having secured such an able manager for his place as Mr. Smith. There are few who have the ability, training and experience necessary to fill so important a position where one must be something of an expert, both in agriculture and horticulture, and at the same time of good executive ability and able to manage large affairs in a thorough and busi-

ness-like manner. Mr. Smith has many friends in the trade, all of whom will be glad to hear of his new appointment and will follow him with their best wishes.

G. C. WATSON.

MARLBORO, MASS.—S. M. Wile is erecting a new 100 foot greenhouse on Hosmer street.

WELLSBORO, PA.—W. H. Whiting has added 2,300 feet of new glass this season.

Fire Insurance.

Among the many risks carried by the greenhouse men throughout this country the danger of fire is not the least. Almost every other industry can find protection in insurance against loss through this destructive element at rates which are reasonable. The florists, however, are in many instances paying as high as 2 and 3 per cent. per annum for their insurance. Again others are paying as low as 1/2 per cent. for the same class of risks. Before ascertaining the latter fact our committee, at that time working under the auspices of the Hail Association, thought a low rate could be obtained by bringing before the insurance companies an intelligent classification of greenhouse risks, showing also the wonderfully safe construction of the modern greenhouses.

As a low rate, however, has been found to exist, our efforts now shall be entirely in the direction of having that same low rate adopted generally by all first-class companies on good structures. To accomplish this result we must first of all have the earnest co-operation of every florist in the land.

In order to act intelligently we should know the number of fires, the total of losses through them, and the nature of the structure during a given recent period of time. Also what insurance there is now carried by the trade in this country, what rate is paid, and by what companies insured.

With this object in view, the following questions are asked, and it is hoped that every florist will devote a few moments to the answers, which shall be directed at once to E. H. Michel, Magnolia and Tower Grove avenues, St. Louis, Mo.

1. State what greenhouse structures, if any, have to your knowledge been partially or entirely destroyed by fire during the year ending August 1, 1893.

2. If there were any, state cause of fire and amount of loss on structures, also loss on plants. Describe houses, whether steam, hot water, or flue heated.

3. A. Do you carry fire insurance?

B. What amount?

C. In what companies?

D. What rate do you pay?

E. Is your stock insured or only the houses?

F. Describe your houses, whether old or new, and style of heating.

G. What is the total value of your greenhouses and of your stock in them?

We trust that you will answer these questions immediately. If you do we shall try to secure for all good and cheap security against loss. Respectfully,

E. H. MICHEL,
J. G. ESLER,
E. A. SEIDEWITZ, } Committee.

J. B. DEAMUD & CO.

Dissolution of Partnership.

August 31, 1893.

Notice is hereby given that the co-partnership heretofore existing between Frank D. Hunter and James Purdy, doing business at 51 W. 30th street, New York City, under the style of Hunter & Purdy, is this day dissolved by mutual consent. Said business will hereafter be carried on by the undersigned who assumes all the liabilities of said firm, and to whom all claims belonging to said firm should be paid.

FRANK D. HUNTER.

Propagating the Clematis.

Replying to the query on the above subject I find that the surest way to increase a stock of clematis is by grafting. The stock I prefer is Clematis viticella (the small blue flowered one), as it does not sucker. Take thrifty, well grown plants in November, select your wood beforehand and use only well developed buds, by the system called "bud grafting," which is very much the same as budding only the bark can not be raised as in budding. In cutting the buds take as little of the wood as possible, for the bark is the active principle. Tie securely and bury in a box of moderately damp sand or sawdust and place in a greenhouse or moderately warm place and examine from time to time. When united and beginning to push out pot them up and bring into light; it will be well to keep a little damp moss over the grafts till leaves begin to open, when they may be exposed to full light and will grow off rapidly, often making strong blooming plants by spring. Water must be used very sparingly till the plants are well established.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June. (will probably be held in Toronto.)

VISITED CHICAGO: W. W. Rawson, L. L. May, R. Maitre, W. P. Durban.

DROUTH has injured the bean crop materially in nearly every section where they are grown.

HENRI L. DE VILMORIN will return to Chicago from a trip to the Pacific coast about September 25.

DROUTH about Chicago continues; hardly a drop of rain has fallen in eight weeks; few outdoor blossoms of dahlias can be found.

AT PHILADELPHIA onion sets are said to be from one-third to one-half a crop; at Chillicothe, Ohio, 35,000 bushels, a usual crop; at Louisville one-half crop.

THE RETURNS from the fall bulb catalogues now being mailed will be anxiously awaited as indicating what effect, if any, the money panic is likely to have on the mail trade, especially the business for the coming spring.

News Notes.

AMHERST, MASS.—M. B. Kingman is making extensive additions to his greenhouses.

WESTERLY, R. I.—S. J. Renter has added two houses 100x16 to his establishment this season.

PORTLAND, ME.—E. J. Hannon & Co. have begun the erection of two more greenhouses.

SPRINGFIELD, MASS.—The Hampden County Horticultural Society will hold an exhibition on September 9.

BATAVIA, ILL.—The nursery business of Williams & Sons has been incorporated with a capital stock of \$7,000.

FRAMINGHAM, MASS.—Wm. Nicholson is adding a new house 150x20, to be devoted to carnations. It will be heated by hot water under pressure.

MARBLEHEAD, MASS.—On August 31st, a very pretty flower show was held at Abbot Hall, under the patronage of Hon. J. J. H. Gregory and Mr. Franklin Reynolds.

QUEENS, N. Y.—C. W. Ward, of the Cottage Gardens, is building a range of short-span-to-the-south houses for carnations and will keep a careful record of results obtained from them in comparison with those from houses of usual construction.

ROME, N. Y.—A terrific hail storm played havoc with glass in this city the afternoon of Sunday, Aug. 27. C. B. Humphrey lost over 2,000 lights of glass on his greenhouses and many of his plants were sadly injured. Morris L. Jones lost 900 lights, but his plants were not so seriously damaged. T. L. Hurst's greenhouse was also injured.

Choice Lily of the Valley Pips.

Ernst Reimschneider, Altona, Hamburg.

For Fall Importation. Catalogues free on application to agents.

LILIUM HARRISII AND DUTCH BULBS.
Special Low Prices to Florists and Dealers.

WEEBER & DON,

Seed Merchants and Growers,
114 Chambers St., New York.

Toronto.

Cattleya Dowiana was flowering in fine form among Sir D. L. Macpherson's collection the other day. It is really a most beautiful thing. Why is it not oftener seen? The lily pond in the Central Prison is a lovely sight just now, in fact the whole of the grounds are almost perfection and are worth going miles to see. In the greenhouses Mr. Houston has a nice piece of Allamanda Williamsi in bloom now, a very pretty thing and sweet scented.

It is reported that Mr. H. J. Cole, late foreman to Mr. J. H. Dunlop, is about to open a florist's store in the Rossin House block. The location ought to be as good as any in the city and it will be surprising if Mr. Cole does not make a hit.

The Toronto Industrial Exhibition—Canada's great fair—opens next week. The manager has made a raid on the Midway Plaisance and we are to have a congress of nations here on a small scale. The horticultural show promises to be good. This exhibition attracts many visitors from the neighboring states and is quite a big affair. E.

Worcester, Mass.

The phloxes in Elm Park have made a great show during the past few weeks. The late gale, however, has damaged them greatly, besides uprooting and breaking a number of fine shade trees. Superintendent Lincoln is an enthusiast on phloxes and as soon as the recent Newton Hill addition to the city parks is put in shape we may expect to see it loom up glorious as an autumn sunset with acres and acres of brilliant phloxes.

Worcester is fortunate in the possession of a splendid horticultural hall and a horticultural library numbering over 3,000 volumes. A. A. Hixon has charge of the hall. Mr. Hixon is an authority on petunias. The society is about fifty years old, and its ex-presidents comprise many men eminent in horticulture.

H. F. A. Lange, after the fashion of all growers, is "adding another house." It is 100x18 and makes now full 60,000 feet of glass in this establishment. Lange drives a span now, and many a good time his friends enjoy behind that span. They are just right for a midsummer evening's drive to beautiful Lake Quinsigamond, Worcester's famous Coney Island.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

TO STOTT GARDEN IMP'T CO.,
136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed BOLANZ BROS., Akrou, O.

See Special Offer Aug. 3 and 17.

P. O. Box 1066, KINGSTON, N. Y.

Boston.

Cut flower trade has been very dull during the week, with a slight improvement apparent during the last day or two. Gladioluses have gone down, away down, and asters, on the other hand, have advanced. Most outdoor stuff suffered considerably in the recent heavy winds and rain. Roses are poor in quality, and the only really choice flower in the market at this moment is lily of the valley, but it sells very slowly. Allamandas, gloxinias and tuberous begonia blooms are available for showy work.

The Growers' Market has been moved from 65 Bromfield street to 1 Park street, which is a much more roomy and convenient quarters. This place was for many years occupied by J. P. Clark as a florist store. Clark has now gone to Dartmouth street. The market is situated under a church, an indication that the Boston growers aim to take a high moral stand, a supposition which is still further strengthened by the rule which refuses admission to the wicked commission men, and by the sign displayed upon the walls, viz., "No smoking." This world is getting better and better every day.

David Allan has bought the estate of John B. Bailey at Cliftondale, and proposes to go into the raising of rare exotics, hardy shrubs and herbaceous plants. There is considerable glass on the place, and Davie's friends think that he has made a good move.

Chas. Ingram has leased the Proctor place at Reading.

Jas. Buchanan, of Edinburgh, Scotland, the orchid fancier, is visiting Boston. He will go to the Chicago exhibition.

A. G. Dibble, of Sly, Dibble & Co., London, England, dealers in horticultural supplies, is also in town.

Winfried Rolker has been canvassing the Hub this week. He finds that there is some life left in the trade here yet, and is well pleased with his success.

Sample Box, by Mail, 50 cts.
E. HIPPARD, Youngstown, Ohio.

Chicago.

Business shows a tendency to improvement, though it is quiet yet. Roses are greatly improved, and also carnations, which continue scarce. The dearth of carnations is likely to be felt more, as asters are falling off in quantity; between dry weather and grasshoppers the supply is suffering a good deal. The continued drouth, which has now lasted for about nine weeks, is affecting the florists seriously, and many are now taking up their carnations, as the only means of saving them. Dahlias, cosmos and other autumn flowers will amount to very little, while the plague of grasshoppers is more like Kansas than Illinois. Asters and carnations are especially suffering from their ravages.

A limited quantity of single violets has appeared, but they are very small. Smilax is scarce; there is very little around Chicago and the main supply comes from eastern points.

John B. Deamud & Co. have moved from the rear to the front of the Cut Flower Exchange, where they have a large and more convenient location.

Paul Cadres has added a new rose house 18x100 to his place at Riverside.

Mr. and Mrs. Wm. Clark, Colorado Springs, Colo., are now visiting Chicago.

Obituary.

Friends of Wm. Thompson, Jr. of Clovenfords, near Galashiels, Scotland (and they are many, even on this side of the Atlantic) will be sorry to hear of his demise. He was a man highly esteemed by all in the trade for his genial brotherly qualities as well as for his wonderful skill in grape culture. To hear him talk of grapes and orchids was a rare treat, never to be forgotten by those who listened to him. He leaves a wife and four children.

Society of American Florists.

President W. R. Smith has appointed Mr. J. C. Vaughan of Chicago to fill the vacancy on the executive committee of the Society caused by the election of Mr. J. T. Anthony as President for 1894.

Do you want a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

PLEASE WRITE ON your printed letter head when addressing our advertisers. If you have no printed letter head, then enclose your business card or bill head.

THOSE WHO WISH to obtain copies of the proceedings of the recent Hort. Congress should register their names with Clarence E. Young, Sec'y World's Congress Auxiliary, Art Institute, Chicago, saying they desire the horticultural section.

Massachusetts Horticultural Society—Annual Exhibition.

The annual exhibition of the Massachusetts Horticultural Society opened at noon on Wednesday September 6, continuing until the evening of the following day. For the first time the exhibition was free to the public. The weather was superb and the hall was full, but at no time overcrowded. The lower hall was devoted to cut flowers only, and these were shown in great profusion. The display of asters, dahlias, and zinnias was very large and in quality unexcelled. The zinnias especially show a wonderful improvement in color and form from those of former years. E. Shepard, F. B. Hayes, Mrs. E. M. Gill, A. L. Cain, F. S. Davis and Wm. Patterson were the principal exhibitors of zinnias. The extensive show of asters by Chas. A. Yates was noticeable for the quality of the blooms and for the skillful arrangement of colors. E. S. Converse, F. B. Hayes and Wm. Patterson were also among the aster exhibitors.

Dahlias in all varieties, show, pompon, single and cactus, were remarkably good. The collections from John Parker and W. C. Winter were about as near perfection as possible. John Parker's "Constancy" took the first prize for specimen bloom and W. C. Winter's "John Bennett" received second prize. Tuberous begonias, petunias, marigolds, nasturtiums and dianthus were all shown in good quality by various exhibitors. Dianthus seems to be at a stand still. As shown here there is apparently no appreciable improvement over those shown ten years ago.

Among the most interesting features of the cut flower department was the display of wild flowers. It is remarkable as well as gratifying to note the interest taken by the public in these little gems from the woods and fields. Mrs. P. D. Richards has always taken the lead in native flowers but on this occasion she was distanced by two young misses in their teens, Eleanore and Molly Doran, who took first prize, a fact which doubtless pleased Mrs. Richards as much as though she had won it herself. The large centre table in the hall was made beautiful with a brilliant display of French cannas from D. Fisher, and the stage was banked with flowers and foliage from the F. B. Hayes estate, arranged by Mr. James Comley. The sides of the upper hall were entirely filled by the four large groups of stove and greenhouse plants from Dr. C. G. Weld, K. Finlayson, gardener, N. T. Kidder, Wm. Martin, gardener, Geo. A. Nickerson, D. Montieth, gardener, and Jos. H. White, J. Wheeler, gardener. In Dr. Weld's display there were some handsome little crotons in 6-inch pots. First premium for six was awarded to the following group: Fasciatus, Mortii, Lady Zetland, Chelsonii, Hanburyanum and Queen Victoria. Among Dr. Weld's best plants were some

good palms and fine specimens of *Heliconia aurea striata* and *Dracena Baptistii*.

The group exhibited by Geo. A. Nickerson contained some grand specimen crotons, one of them a magnificently colored *Queen Victoria*, which took first prize for specimen variegated plant. His ferns were also extra good, especially the *adiantum*s. The following varieties were awarded first prize for five plants: *A. concinnum latum*, *A. trapaziforme*, *A. scutum*, *A. amabile* and *A. tenerum*. N. T. Kidder took first prize for specimen ornamental leaved plant with *Alocasia Sanderiana*, a noble plant. Also first on six dracaenas with *D. indivisa* varieties, *D. Lindenii*, *D. Wellesleyana*, *D. Robinsoniana*, *D. Butlerii* and *D. Massangeana*. His *caladium*s and *lycopods* were also the finest in the hall.

J. H. White's group contained some well grown and finely bloomed fuchsias. A central object in the exhibition was his specimen plant of *Nephrolepis exaltata*, a wonderfully fine specimen with fronds five feet in length. On the stage were two grand ferns from N. T. Kidder, *Davallia Mooreana* which was awarded first prize for specimen fern, and *Davallia Fijiensis*, which received a silver medal.

Pitcher & Manda staged an interesting group of novelties, among which were *Aracaria excelsa compacta* (silver medal), *Geonoma acaulis* (bronze medal), *Begonia La Neige* (certificate of merit), *Cypripedium luridum*, hybrid *Lawrenceanum X villosum superbum* (certificate of merit), *Cypripedium Allamianum*, hybrid *Spicerianum X Curtisii* (certificate of merit), *Nephrolepis plumosa cristata*, *Dieffenbachia Memorice Corsii* and a pure white variety of *Anthurium Andreanum*.

The display of aquatics attracted more attention than anything else in the exhibition. What society will be the first to get up a special aquatic exhibition? The possibilities for novel effects in such a show are almost unlimited, and it would rank with, if not excel, the chrysanthemum show as a popular attraction. Try it somebody. The two exhibitors in this department were John Simpkins and William Tricker. All the fine nymphæas were shown, such as *Zanzibarensis*, *dentata gigantea*, *Devoniensis*, *rubra*, *chromatella*, *Laydekeri*, *Marliacea* in several varieties, etc. The blooms shown by Mr. Simpkins were of extraordinary size and beauty. Mr. Tricker's collection included four seedlings, one from *gracilis*, violet color, one from *Carolinensis*, one from *dentata X rubra*, pink, and one from *lotus X Sturtevantii*, also pink. He received also honorable mention for a tuberous hybrid.

N. T. Kidder was awarded a certificate of merit for *Allamanda Williamsii*, a blooming plant in pot, and to George McWilliam was awarded a silver medal for superior culture of *Caladium argyrites*. E. A. Wood staged a fine collection of foliage begonias. K. Finlayson received

a certificate of merit for a well grown specimen of *Pteris tremula* Smithiana.

Four private gardeners competed for the prizes for single plant for table decoration dressed at the base with living plants only, and first premium was won by D. Monteith. The plant was *Croton irregularis* and its base was dressed with *Pteris serrulata*, *adiantums*, *tradescantia* and grasses. Mrs. Geo. L. Brown showed a pot of *Vallota purpurea* grown in dwelling house, bearing thirty-seven vigorous stalks of flowers.

That much coveted but seldom received award, the gold medal, was awarded to Geo. McWilliam, gardener to Mrs. J. Lasell, for a display of foreign grapes. The following kinds were shown: Black Hamburg, nine pounds and one and one-half ounce, Trebbiano, ten pounds and three ounces, Lady Downes, Madresfield Court, Tyringham Muscat, Alicante, Wilmot Hamburg and Muscat of Alexandria.

Among the visitors to the show were Mr. and Mrs. H. H. Battles of Philadelphia, W. A. Manda, Short Hills, N. J., Jas. Buchanan, Edinburgh, Scotland, A. Ingram, London, England and W. C. Tricker, Dongan Hills, N. Y.

Aquatics.

The ponds of aquatics at Lincoln Park, Chicago, are now about at their best and are worth a long journey to see. During a walk around these ponds with the writer Superintendent Pettigrew related his experience with the various varieties of nymphæas as follows:

With him *N. alba candidissima* stands at the top as a day-blooming white variety. It is a good grower, flowers are well shaped and of fine color and the plants bloom all summer till frost. It is superior to *N. odorata* in being a stronger grower and a much freer bloomer. It is better than *N. tuberosa* for all round work, as the latter is through blooming by the middle of August.

N. Marliacea alba has all the desirable qualities of *N. M. chromatella* and is a very desirable white nymphæa. Every member of the *Marliacea* group does well with him.

N. gracilis, a sort introduced from Mexico a few years ago, he thinks very highly of. The plant is a strong grower, a very free bloomer and the straw white flowers stand up a foot above the water. The petals are narrow and long and the flower somewhat resembles that of *N. dentata* in form.

Of other white flowered day-blooming nymphæas he has *odorata*, *alba* and *pygmæa* to round out the collection, but he says that if he was limited to one day-blooming white it would be *N. alba candidissima*.

Of the night-blooming white sorts *N. dentata* is decidedly the best. And certainly it leaves little to be desired. The flowers are very large, about 10 inches across, the petals stand straight out, and under the electric light the flowers resemble huge white stars.

N. lotus, yellowish white, is the only other night bloomer he has that may be classed as white.

Of the day-blooming red or rose colored varieties he places *N. Marliacea rosca* at the top. It is a strong, free grower and exceedingly floriferous, has handsome foliage and is much better in every way than *N. odorata rosca* with him.

He thinks very highly of *N. Laydekeri rosca*, a new sort recently introduced. The flower is small—about midway between those of *alba* and *pygmæa*, but are

very freely produced, and the color, which is a fine shade of rose the first day, is on the following day suffused with yellow shadings. The one season's trial he has given it has left a very favorable impression.

N. Marliacea carnea has the same general habit as *N. M. rosca*, but the color is a delicate flesh tint.

N. Caroliniensis is a sort he is trying for the first time and he considers it promising. It is said to be a new species from the Carolinas, but by some it is considered a hybrid.

N. odorata rosca flowers well in May and early June, but as soon as hot weather comes the foliage burns and it ceases to flower. Mr. P. thinks that probably it requires deeper and cooler water than he is able to give it.

N. Zanzibarensis rosca is very useful on account of its strong growth, large blooms freely produced and the fact that like all the *Zanzibarensis* group it can be quickly and cheaply grown from seed. It is the largest flowered of the rose colored day bloomers.

Of the night blooming red sorts *N. Devonensis* still beats them all in freedom of growth and bloom. On a recent evening 28 open blooms were counted on one plant, and with a few such plants in bloom the pond is a gorgeous sight, being well illuminated during summer evenings by a circle of electric lights.

He has tried *N. Sturtevantii*, but found it very hard to grow and blooms exceedingly scarce. It is a lovely flower when you get it, but they are too few and far between.

N. rubra has handsome reddish brown foliage. The flowers are much like those of *Devonensis*, only smaller. It is just as free blooming, too, and he finds little difference between the two except in size of flower.

Of the blue flowered day-blooming sorts *N. Zanzibarensis* and its variety, *azurea*, stand at the head. The first is dark purple and the last sky blue in color. The flowers average 10 inches in diameter and he has had specimens that measured full 14 inches across.

N. scutifolia has a small, light blue flower with pointed petals, very freely produced. The plant blooms all summer long.

N. cœrulea resembles *scutifolia*. The flowers are smaller, but are fragrant.

All the yellows are day-blooming. *N. Marliacea chromatella* is his favorite. It is the freest flowering yellow. It begins blooming the latter part of April and continues till frost. Outside of color its characteristics are the same as the rest of the *Marliacea* group.

N. odorata sulphurea has a very handsome flower as large as those of *tuberosa*, but they are not very numerous.

N. Mexicana resembles *flava* in growth and size of leaf, but is much more free flowering. A desirable sort.

N. flava has handsome foliage, the leaves small, green, flaked with chocolate. The flowers are a fine shade of yellow, small, but pretty. Unfortunately it is a shy bloomer.

In reference to the hardiness of the various nymphæas Mr. Pettigrew says that while none of them will stand frost at the roots he finds that the following are hardy in two feet of water: The *Marliacea* group, *odorata* group, *tuberosa*, *Mexicana*. None of the others can be safely left out over winter here.

He finds that the *odorata* varieties and *tuberosa* do best in deep, cool water. The *Marliacea* varieties like water with a temperature of 75° to 80°. The *Zan-*

barensis varieties, *dentata*, *lotus* and *Devonensis* will do fairly well in the last named temperature, but if you wish them to do their very best you must give them water with a temperature of 90°.

The *Marliacea* group and *tuberosa* have a tendency to bunch the foliage in growing, but this can be readily overcome by dividing the plants to one crown only each spring and planting one in each corner of the box, or about 4 feet apart, instead of one large plant in the center. Where plants are already bunched pick off sufficient leaves to thin the bunch and expose any hidden flowers to view.

A rascally little leaf-miner has been doing some little damage to the nymphæas of late. He is a dirty white in color, about 3/8 of an inch long and works just under the first skin of the upper surface of the leaf, leaving very noticeable ridges that indicate his burrows. Mr. P. has not yet learned of any means of combating him except to pick off and burn all affected leaves as soon as noted.

Another dirty white rascal is at work on the nelumbiums. He is about an inch long and attacks the leaves in the center, burrowing down the stem, sometimes clear below the water line. Hand picking of the leaves is the only remedy yet known. Mr. P. will send specimens of these pests to Prof. Riley for identification and will report the names and means of combatting them, if any is known, through these columns.

The nelumbiums, in spite of the worm, are looking finely at present, their great pink blooms being specially conspicuous on account of their being carried so high above the foliage. There is a white form in one of the ponds that is useful in a collection, but which is of course not such a striking flower as the type.

Euryale ferox is doing nicely in one of the lower ponds and Mr. P. considers it a very desirable addition to his collection.

Large colonies of *Eichhornia crassipes* are now in beautiful bloom. No pond of aquatics is complete without a goodly group of these. And we confess a great weakness for the fragile yellow water poppy, *Limncharis Humboldtii*, that blooms so freely and constantly. Also the *Limnanthemum indicum*, with flowers smaller in size, but distinct in form.

At Lincoln Park the aquatics are one of the chief attractions, and as it is visited by countless thousands of people a fair knowledge of these plants is being rapidly disseminated among the people, and that a desire for them is spreading can not be questioned. When it is made plain to the people that an artificial pond can be made at comparatively small expense the demand for these aquatic beauties will be great.

By the way, what an excellent shrub the native *Hibiscus moscheutos* is for planting on the margin of a pond! A specimen on the margin of one of the upper ponds in Lincoln Park has been a striking feature all summer long, its numerous large, handsome blooms attracting much attention.

Notes on Propagation.

The sowing and treatment of fern spores have been frequently described in the *FLORIST*, but this class of plants having become so necessary a portion of the stock in many establishments, some slight reference to the methods of procedure may be admitted in these brief notes.

The first essential is to procure spores of good quality, and the surest method is to keep a few old plants for stock, from which the fronds should be gathered

VERANDA BOXES.

from time to time as they mature, and placed in paper bags, or else wrapped in clean paper and laid away in a dry place. After drying and cleaning the spores may be stored away in small vials, and thus kept secure until needed. In order to keep up a stock of ferns it is best to sow several times in the year, and in this manner keeping some store pots of seedlings on hand all the time, in readiness to be potted off whenever some space can be spared for the purpose.

Six inch pans or pots are the best size in which to sow the spores, and only a moderate heat is required for their germination, while close attention is required in the matter of ventilation, to prevent the appearance of fungus among the young seedlings. It is more economical to prick out the young plants into other pans or boxes as soon as they are large enough to handle than to allow them to remain in the original seed pans until they are potted off, as in the latter case many of the seedlings will be spoiled by overcrowding, and a considerable percentage of the crop lost.

For the killing of worms and insects and the prevention of fungus it is a good plan to bake the soil before sowing the fern spores thereon, but this is not absolutely essential to success in the operation, it being more necessary to water and ventilate carefully, and to keep an even temperature of 60° to 65°.

Various small operations of grafting will suggest themselves to the florist doing a general trade, some of which may be attended to now if time permits.

Among these is the working of a few plants of *Aralia Veitchii* in readiness for next season's vases and window boxes, this plant doing admirably for this purpose and adding greatly to the elegance of a vase of foliage plants. *Aralia Veitchii* does not root rapidly, and it is therefore quicker and more sure to graft it on one of the free-rooting species, *A. reticulata* and *A. Guilfoylei* being among the best for the purpose. Either cleft or side grafting may be used for this operation, the last named probably making the neatest job and the strongest union, the plants being kept rather close in a propagating frame until the wounds have caloused, which usually occurs in from two to three weeks.

Another plant that is quite saleable and not difficult to propagate is the mandarin orange, these also being secured by grafting on seedling oranges or lemons, the operation being a very simple one and not requiring a very high temperature to insure success. Of course mandarin oranges grafted this fall will not be saleable stock for next season, as their growth is somewhat slow, but for some of those having space to spare it may prove an experiment worth trying.

Ardisia seed may be sown at any season as soon it is thoroughly ripe, a light, well drained soil being used for the purpose, and the seed pans or boxes being placed in a house in which a steady temperature of about 60° is maintained. The young plants should be potted off into small pots as soon as they are large enough to handle, and shifted on in time to prevent

stunting, while giving them space enough to permit stocky growth.

Asparagus plumosus is a particularly useful plant for the decorating florist, and nice young plants of it are generally in demand. These are best secured from seeds, the latter usually germinating readily, though somewhat irregularly, and it is therefore safer to give the seed pans some months of grace in which to redeem the promises of the innocent seedsmen, even after the first crop of seedlings have been pricked out or potted off.

W. H. TAPLIN.

Veranda Boxes.

The engraving is from a photograph of a veranda box of which a section (when first filled) was illustrated on page 1235 of the *FLORIST* for July 6 last. As seen in the picture the box is 18 feet long, and it will be noticed that the plants have made a considerable growth since the box was filled, which was the first week in June. There is a small rubber plant, an unsightly pandanus and a small palm seen in the illustration which do not belong to the box; they were standing on the rail of the veranda.

The dimensions of the box inside measure is nine inches across at top, eight inches at bottom, and eight inches deep. The drooping plants in it are vincas (variegated and green), senecio, ivy geraniums, lobelias, glechoma, petunias (single), lophospermum, abutilon, solanum, nasturtium, money vine, *Nierembergia gracilis*. The upright plants consisted of

Crozy cannas, *Dracena indivisa*, a few small palms (*latania* and *Arca lutescens*), *nephrolepis* fern, *anthericum*, *coleus* (several varieties), *Caladium esculentum*, geraniums (several flowering varieties), variegated geraniums, *achyranthes* and a few *fuclias*. Wm. SCOTT.

Buffalo, N. Y.

Seasonable Notes.

In answer to "Subscriber," buds that are showing on young roses now should be carefully picked off just as soon as seen, unless blooms are wanted immediately, but where a good crop of extra fine flowers are needed from these the first to 15th or 20th of October, all buds showing from the present time on should be carefully picked off. In fact it is very questionable policy whether it is advisable to leave the buds to mature into blooms before the 15th of October on any young roses, as it undoubtedly weakens the plants very much to allow them to do so. To have a bud matured into a size suitable for market takes a great deal of strength from the plant, and furthermore the bud cannot be marketed without several leaves going with it, which means taking away some of the most vigorous healthy part of the plant; hence I would advise "Subscriber" to cut all his buds off just as soon as he can see them, allowing the plant to grow as vigorously as possible, keeping it healthy, free from mildew, red spider, etc.

We have now gotten to a part of the year where a great deal of care will need to be exercised in keeping down the above troubles; not only mildew, but what is known as "damping off" in the fall of the year. This is caused by having too much moisture in the houses with a moderately low temperature. The best way to avoid it till the time for steady fire comes is to syringe the plants very early in the morning and not over water them at any time, allowing all the surplus moisture to dry out during the day by having abundance of air at any and all times when it is possible to do so; this will insure a nice, dry, even atmosphere in the house. Should any indications of dark brown spots make their appearance a slight amount of fire heat should at once be applied so as to take off the surplus moisture in the morning, and where the temperature—which too often happens—does not fall often below fifty-six I would advise in every case leaving a little air on all night, lighting a fire—though only just enough to warm the pipes so as to expel the heavy dews of the morning. One of the best preventives for mildew is a liberal amount of air on all and every occasion it is possible to get it, having the house five or six degrees above the normal night temperature before putting on the air and gradually increasing the amount till the full amount needed for the day is put on. This method will prevent mildew to a very great extent.

In reference to red spider, liberal syringing under the foliage on every opportunity possible is really the only safe-guard against it; care being exercised at the same time not to get any part of the soil

saturated with too much moisture, because in that event it will check the plant and give the red spider an opportunity to get a foot hold; when this once occurs it is very hard to dislodge them afterwards. This is the time of the year when all these things should be watched more carefully than at almost any other season of the year, because the foundation for future troubles is often laid during the fall, though not observed by many unless watched very carefully. J. N. MAY.

Kentias Belmoreana and Forsteriana.

ED. AM. FLORIST: Will you kindly inform me through the columns of your valuable journal which of the two palms, *Kentia Belmoreana* and *Kentia Forsteriana*, have the broadest sections in their leaves when the plants attain a moderate size. IGNORAMUS.

The leaves of the kentias are very variable in regard to the breadth of their leaflets, but in general those of *K. Forsteriana* are much broader than those of *K. Belmoreana*, the latter variety also having a greater number of leaflets. For instance, the larger leaves on a good plant of *K. Forsteriana* in a 6-inch pot will average from 14 to 20 leaflets, while those of a corresponding plant of *K. Belmoreana* will average from 20 to 27 leaflets. The last named variety also has much shorter footstalks and is more compact and graceful in habit. W.

Seasonable Hints.

There may be some difference of opinion whether carnations should be grown on the same ground or not year after year. We think it advisable to make a change if one has ground enough to do it, but we have known the same ground to be used for many years in succession without apparent detriment to the plants. Where so planted year after year it will be found very advantageous to sow the ground with some green crop as the plants are removed. For this purpose rye answers admirably. The grain should be sown as soon as the plants are lifted, section at a time, or if the whole field will be cleared in time one job can be made of it. Simply running the hand barrow over the ground will cover the grain sufficiently, but of course a horse cultivator would be better. Even if sown as late as November the rye will make a good growth for plowing down the following May; but the sooner sown the larger the growth. One to two bushels per acre is about the right quantity. If sown late more is required than if sown early. The rye acts as a retainer of the plant food ingredients of the soil, preventing their waste from the otherwise bare ground during winter. When plowed under in the spring it is an excellent fertilizer, and makes an excellent bed for the young roots to luxuriate in.

If it is desired to give the ground more rest and improvement the rye should be sown with red clover. The rye is then to be harvested, preferably early as straw or for green feed and clover allowed to remain for another year, when it can be plowed down when wanted. There is no

better bed for carnations than a clover sod.

The crimson clover (*Trifolium incarnatum*) is recommended very highly for a green crop for plowing under. It can be sown as late as the latter part of October. As it grows all winter it will make growth enough to plow under in April; but of course the earlier it can be sown the better. Sow at the rate of fifteen pounds per acre. Simply rolling is all that is necessary to cover the seed. By using some such green crop in the field and plowing it under in the spring we believe carnations can be grown for many years in the same ground, and the soil probably improve under the treatment. Of course we would supplement the green crop with a good dressing of manure applied in the fall, or if well rotted, in the spring. Occasionally apply a dose of fine ground bone or bone black.

Avondale, Pa. W. R. SHELMIER.

An Unfortunate Blunder.

ED. AM. FLORIST:—Last winter we bought 400 Silver Spray carnation cuttings from a well known florist in the east, and now that some of them are blooming it is seen that they are every one Mrs. Fisher and not Silver Spray. We have written the party and he says that at this late date he can not remedy the mistake. What would be right for him to do in this case? C. B.

[We would like to hear from some of our carnation growers in reply to the above query.—Ed.]

Miscellaneous Seasonable Hints.

Chrysanthemums will now need a great deal of your time and attention. There is very little demand and very little money in growing sprays nowadays; fine flowers on long stiff stems are what the public demand. The earlier kinds, such as Mrs. Whildin, Ivory and many others, are showing their buds, and disbudding must be attended to as soon as they can be handled, that is, rubbed off. I have not seen or heard of any tool that can do that better than your fingers. It is rather a delicate operation, especially if done when the buds are very small, and that's the time to do it. If the crown bud is perfect then rub off the surrounding buds; if it is not a perfect shaped bud pinch it out and choose one of the other buds to make your fine flower. If you do want a few sprays, and some sorts look very fine that way, particularly old *Gloriosum*, then pinch out the crown bud and let the three side buds develop. They will all be about a uniform size. Of course you will keep all side shoots pinched off the stems. Be sure to keep your stems tied up; it pays well to do this. If allowed to sprawl about the bench the flowers are likely to be injured and you will have bowed and crooked stems, and how can you arrange a vase of mums with these cripples without a lot of work and wire, and then they don't look well.

This is the time of year when the chrysanthemums need the greatest amount of water and naturally will take the greatest amount of stimulant. I have not had experience with all the different manures said to be good for them. I have found a watering once a week with nitrate of soda to give the foliage a fine deep color. So does soot from bituminous coal; about one half peck in thirty gallons of water is a great help to both foliage and flower.

About now cover your beds and benches with one inch of half rotten cow manure. As a manure it is of course a great help,

HOW TO MAKE RUBBERS BREAK NATURALLY.

but besides that it is a fine mulch and prevents the beds from drying out every day, and they do dry out pretty fast now where you have only 4 or 5 inches of soil and that is full of roots.

By this time your houses should be glazed tight so that you can fumigate. Don't smoke too strong or you will burn the young tender leaves; three nights in succession and mild will fix our enemy, the black aphid. Last year a few days before our exhibition I had a big crop of the aphid still left on the mums that were going to the show. As the flowers were of course fully developed and some of them on their last legs I was puzzled what to do. Tobacco dust would dirty up the flowers and plants and so would tobacco water. I asked a learned friend how smoke would do and he shook his head; but I fumigated two successive evenings, and heavy at that, the fly was gone, but not a petal was bleached or dropped, in fact not a particle of harm was done.

The same tedious job of disbudding must be done with the plants you have lifted from the bench and potted. One dozen fine flowers on a plant in a 6-inch pot will sell it much quicker than three dozen good, bad and indifferent flowers. Many people are under the impression that because the chrysanthemum will grow in a low temperature and is hardy in most parts of Great Britain that it should have a low temperature at all times. This is a mistake. Look how they thrive planted out in our houses in a tropical heat in midsummer. When opening their flowers give them some fire heat, with a moderate amount of air, and the colored ones should have a slight shading. The coloring of the flowers will be far better if kept in a day temperature of 70° than they will at 45°, and they don't like a cold draught any more than a rose.

It is a good time now to label any of your seedling Crozy cannas that show qualities good enough for you to propagate next year's sales. I don't mean you should name them and send them out to the public, but mark and describe them for your own use. Don't delay housing all your tender stuff till some afternoon when you can feel frost is coming. Such odds and ends as heliotrope, lantana, lemon verbena and other things that you have summered over in pots for future stock can be got in at any time. That useful plant sweet stevia should be left out as late as possible (but no frost must touch it), because it is most useful at Christmas and must be retarded as much as possible. Bouvardias, if not lifted, should be at once and planted on the benches. This once popular flower is little heard of now, but where a mixed lot of flowers is needed it is useful, but hardly profitable. It wilts badly if many

of its fibres are lost and needs for a few days shade and constant syringing. It does not pay to give the bouvardia a side bench in a cool house where you will get but one good crop. It should be planted on a middle bench with head room as you would give roses, and with a night temperature of 60° or more you will get flowers from October till July.

WM. SCOTT.

Buffalo, September 11, '93.

Philadelphia.

The September meeting of the Florists' Club was held in the old library room. The surroundings were not very cheerful looking, but as there was a good attendance the appearance of the room was soon forgotten in the proceedings of the meeting, which were quite interesting.

Secretary Farson stated that he hoped before long to have a temporary roof erected over the front portion of the hall, that had not been damaged by the fire, and get this part of the property into such shape that it could be used. When this is done the club room down stairs will be fitted up a bit, the pool tables brought back and then the members can enjoy themselves as of yore.

Vice-President C. D. Ball occupied the chair in the absence of President Craig, who is again in Chicago, this time, we believe, to superintend the decoration of the state building on Pennsylvania day.

The various committees in connection with the trip west reported and were discharged.

The convention of 1894 was discussed and as the society was to be the guest of the club it was thought best to look ahead and see that good halls suitable for meeting and exhibition purposes be examined and the refusal of the same obtained for the executive committee. A committee was appointed to attend to this matter and requested to report at the next meeting of the club.

Nominations for officers for the ensuing year was next in order and the following gentlemen were nominated: For President, Edwin Lonsdale; Vice-President, Henry C. Shaefer; Treasurer, Thomas Cartledge; Secretary, Henry F. Michell. As there was but one person nominated for each office the election next month will no doubt pass off very smoothly, and it would be well for the candidates to come prepared with little speeches expressing their surprise, etc.

The "Calamity Howlers" are fast passing out of sight; they are either becoming converted or are being relegated to the rear where they belong, and where they are sure to find congenial company. These pessimists as a rule are people who do not get along very well themselves and are always looking about for some reason other than the true one (which they would find at home if they would only look there for it) to explain their position.

Business is improving, slowly but quite up to, if not a little ahead, of last season at this time. There are plenty of flowers to be had, yet the gentlemen who trundle the boxes about town seem quite well satisfied with the results, as they manage to find sale for all their good stock at the following prices: Roses, La France, Brides, Testouts, Mermets Bridesmaid, 3 to 4; Niphetos, Perles, Hostes, 2 to 3; Meteors, Kaiserins, 5; Beauties, 1 to 2 a dozen. Carnations are poor and sell for from 75 cents to \$1 a hundred. Asters are coming again; the chrysanthemum aster, a late variety and much larger than the earlier sorts, is now very fine; there are only two colors, however, white

EXEMPLIFIED BY MR. HARRIS AT ST. LOUIS.

and light pink; they sell for \$1 a hundred. Valley is 4 to 5. Tuberoses are poor, being nearly all buds, having only a few flowers open, which soon close up; the dry weather is given as the cause. Smilax is plenty and brings 15 cents, asparagus 75 cents.

The insurance companies and the trustees of Horticultural Hall have come to an agreement, and of \$40,000 insurance the trustees will get something over \$37,000. There was a long delay in the adjustment of this loss, which made Superintendent D. D. L. very weary (so he said); finally by a little "Farsonian" diplomacy the third adjuster was selected and the matter settled up in a short time.

A match game of ten pins between two teams captained by Messrs. Geo. McLean and George Craig was played on the alleys Thursday night last, which resulted in victory for Captain Craig's team by 36 pins. Brown was No. 1 in the match with 524 pins to his credit in the three games, while John Nisbet covered himself with glory by making 242, the highest score ever made in a match in a single game and within 4 pins of the record on the alleys, which is 246, held by Geo. Anderson.

New York.

Cut flower trade is still very unsatisfactory, but somewhat improved over the condition of a week ago. Roses are much more abundant. Small roses are very slow sale. American Beauties are coming in in larger quantities than ever before at this season. Asters are getting short and carnations are very scarce. The regular meeting of the Florists' Club Monday evening, 11th inst., at the Grand Central Palace, was the first meeting in the new club room; very pleasant quarters. There was a large number present. Mr. Keller, for the exhibition committee, reported that the revised schedule would be distributed this week. There are very few changes from the preliminary schedule. Prospects are good and there is every reason to look for a successful show.

Captain O'Mara, of the victorious bowling team, being called upon was received with tumultuous applause. He carried a satchel from which he produced the two cups won at St. Louis. After inspection of the trophies by the members a motion by Mr. Weathered that they be filled and circulated was carried with great unanimity. A vote of thanks was passed to the bowling team.

Mr. Seyderhelm, from Germany, the Thorley of Hamburg, being present, was called upon and responded in German, expressing thanks for the welcome and his pleasure at meeting with such a body of American florists.

Mr. Thos. Griffin, of Westbury, had a

fine display of blooms of tuberous begonias on exhibition, which were much admired and declared to be ahead of those shown last year.

Messrs. Julius Roehrs and Gus Bergmann were called upon to tell of their European trip, but pleaded modesty and were excused.

Mr. Weathered then appeared and superintended the filling and subsequent emptying of the cups as though he had been accustomed to it all his life.

Boston.

The florists are complaining of dull times just now. There is not much doing excepting funeral work, and even that seems to have slackened up a little. Roses are in slightly better demand. Carnations are quite scarce. Asters have got past their heavy crop and are selling briskly, white ones bringing as high as a dollar a hundred at sight. Tuberose on spikes are beginning to come in. They bring about \$1 per hundred for the open blooms.

Choice of location of stalls in the new headquarters of the Boston Co-operative Association was sold at auction on September 4. About seventy-five growers were in attendance and bidding was quite brisk. First choice was sold for \$30, second \$25, then prices ranged from \$20 to \$15 and \$10 down to \$5, the lowest sales being at \$3.50. Quite a sum of money was realized from the sale.

Peter Ball has been making extensive improvements in his establishment at Malden. He has thrown out a number of his small hot water boilers and has substituted a large steam heating apparatus. His American Beauties never looked so fine at this season of the year as they do now. Mermets and Brides are also in splendid condition and Peter is counting upon having a big winter's trade.

Among the pretty things now in bloom at the Arnold Arboretum is *Clethra tomentosa*. This is a more beautiful plant than *Clethra alnifolia* and remains in bloom until November. *Rosa Wichuriana* is still blooming quite freely. Among the novelties of this year from seed is an *Astilbe Japonica*, which is a fall bloomer, and is just now in its prime. The foliage varies from the well known spring blooming species, the leaves being more glossy on the upper surface. The individual flowers are larger than on the common species and there is a faint tinge of pink in the color. Another novelty is a finely variegated *Celastrus articulatus*.

The value of knowing when to gather the seeds, how to handle them and plant them is seen in the result from rhododendron (*azalea*) seeds collected by Prof. Sargent in Japan less than a year ago, which were sent here and planted by Mr. Dawson in December last. Many of the young plants are already six and seven inches in height, having been pricked off twice.

Mr. Dawson is recovering slowly from his late illness and is able to go about with the aid of a cane.

Chicago.

Business shows a decided improvement over last week, and there is no doubt the fall trade is beginning favorably. The demand is for the best class of flowers. Some very good roses are to be seen, fine Meteors and La France, and especially good Beauties, which sell well. Carnations have much improved in quality and the best are firm at \$1. Their sale is

improved by the scarcity of asters, which are now over. Single violets are to be seen, but not in sufficient quantity to be quoted. Speciosum lilies are still coming in; some extra good rubrum were noted, which sell for \$5. Auratum is scarce, but fine flowers are sold for \$8 to \$10. Gladiolus is gone. There are no dahlias coming in; a good rain would bring them in in quantity, but they are so completely dried up that they are not opening their blooms. Cosmos has not yet shown itself and it too is suffering from drouth. There will be few outdoor autumn flowers according to present appearances, but prospects for trade appear good.

Prices continue the same as last week, but they are firmer and generally keep to the higher figures.

Among recent visitors were Chas. Wachendorf, Atlanta, Ga.; C. H. Joosten, New York; Otto Ramsberger, Newark, N. J.; S. J. Reuter, Westerly, R. I.; F. M. Pennock, Charlestown, W. Va.; R. A. Betz, Cincinnati; B. Haar, Omaha, Neb.; A. Wadley, New York City; L. H. Eckhardt, Nashville, Tenn.; Miss C. B. Flick, Fort Wayne, Ind.

Baltimore.

The members of the club who attended the excursion to Fairy Grove had a good time, whether their taste led them to the dancing floor, the bowling alley, the woods or the water; they had a good time all the same. Paddling about the inlets and creeks with a fair damsel seated in the stern of the boat, drifting along the shallow water, picking out crabs now and then with a dip net or racing to the station landing to see who had come on the last train, the little fleet of boats was kept busy. Then the family parties that collected here and there in the woods marked a new thing and one that ought to be kept up. Why should we not have every year a social reunion like this and bring the wife and children along? What a charming thing it was to see, when the enthusiastic bowlers had done themselves up, the ladies take the floor, and what peals of laughter and applause when one with steady hand sent the heavy globe spinning along the floor and made a strike. Altogether it was a well devised scheme and one that reflects great credit on the chief committee man, Mr. F. Bauer, to whose perseverance and hard work the members are indebted for a most delightful day.

Quite a flurry in retail circles was caused by the death of a leading musician and composer, Mr. Adam Itzel, Jr. Among the multitude of floral tributes were "lyres, harps, a violin, piano, baton of flowers and numerous other emblems beautifully expressive of the art of which the Baltimore musician had been so worthy a disciple," to quote a leading daily. The pieces were doubtless beautifully expressive of hard cash to the men who furnished them, but as for art, perhaps the less said the better, though they were as good in their way as possible.

Business as a rule is very quiet, the supply of really good flowers scarcely up to demand, but medium and common things perfect drugs. Prices unchanged.

MAcK.

St. Louis.

Trade still continues fair for this time of the year, although things are very quiet. A comparison made by several firms in their books at present and during this time last year shows a marked gain for this season. This, coupled with the increasing confidence in the financial

situation and the splendid record St. Louis has made during the late money disturbances, gives us an excellent outlook for the coming winter.

The trade here are much exercised over the failure of the "Elleard Floral Co.," which has during the past week assigned to Stacius Kehrman, Sr., under a mortgage held by him. The assets as figured out by the appraisers amount to about \$1,400; this includes everything. The liabilities as yet are unknown, although a meeting of the creditors was to have been held during the week. The general opinion, however, is that it is a bad failure. All three of the wholesale men have been caught for more or less, the total of their claims amounting to about \$600. What action they will take has not as yet been decided upon; it is supposed, however, they will act in unison.

The C. Young & Sons Co. are mailing their retail fall catalogue. The large additional steam boiler they are putting in has been placed in position, but work is at a standstill on it, owing to a strike among the boilermakers which has been in progress for a month or more. There is a prospect of their coming in during the week.

In my notes of August 24 a slight error appeared in regard to damages awarded Mr. Jablonski for loss suffered by inundation. The estate offered to allow \$600 for damages, but as an offer of \$600 in cash had been refused at the time of the occurrence, it was not accepted. The estate is involved and in accepting their offer of \$600 chances of collection would be assumed the same as any other creditors, with the probability that only from 25% to 50% would be paid. So an appeal was taken to the Circuit Court asking that the full amount of damages be awarded as per estimate at the time, amounting to about \$2,000. R. F. T.

Buffalo.

There was a large delegation of Buffalo florists visiting the Elmira state fair last week. The display of plants and flowers (a large, spacious building devoted entirely to them) would do credit to a much larger city. The premiums offered were most liberal, really worth the trouble and expense of an exhibit. The premium list attracted several exhibitors from out of town, among them Pitcher & Manda, J. H. Rebstock and Wm. Scott of Buffalo, who came in for a good share of the handsome premiums. Pitcher & Manda's collection of stove and greenhouse plants was the center of attraction and their collection of cut flowers was also very fine. An amusing feature of the exhibit was that Rebstock took first over Pitcher & Manda in 12 variegated plants, since when Mr. R. will hardly recognize you as you pass by. Grove P. Rawson, Mrs. Wells and several other local florists made large exhibits in nearly every department. Mr. Cowell, who had charge of the horticultural department to the entire satisfaction of the management, had to leave home to begin his professional duties and deputized Mr. Mepsted to take charge. Before leaving home on Tuesday Mr. Rawson invited the visiting florists with the judge (Mr. Fry of Rochester) to step into his parlor at 7 in the evening, which we did to the number of a dozen or so, and a delightful two hours was spent. "Joe," who is a judge of the best brands, said it was "Mumm's" sure.

The long looked for rain came, but not as "the gentle rain upon the earth beneath." It came as a summer blizzard and leveled trees and corn, and even car-

nations have a decided leaning to the southwest. I hear of no great loss among the florists hereabout either in buildings or stock, and if there was a little we could stand it, for never was rain more needed here. And to make us entirely satisfied another four inches fell on Thursday last. Business, as was expected, is picking up and no doubt will improve steadily now. The tourists returning are sincerely welcome; not only will they buy flowers, but the good ones will settle their last spring's accounts, which they didn't have time to bother about in their hurried departure for Europe or the seashore.

The carnations, which seem to have suffered in many parts of the country from the drouth and grasshoppers, are looking well in western New York. I noticed a field of them at Mr. Rawson's which were very fine. W. J. Palmer, at Lancaster, has a grand lot. At the carnation village of Corfu Webb Bros. have 20,000 fine plants. W. Scott has 5,000 or 6,000 as fine as he wishes them to be, and Messrs. Giddings, Edwards, Tyrrell and Farnham all report their plants good except that the grasshoppers have nibbled the buds badly. This is a good test and a proof that the carnation will stand in the open air an extremely protracted dry spell. Webb Bros. found the grasshoppers difficult to deal with, but found the best thing was to hire a young lady attired in cinoline and a dress of soft texture to walk up and down the rows. The grasshoppers got scared and made for the nearest pasture, and it takes them several hours to hop back again, and it's so much more picturesque than Paris green. Mr. Valentine Hammon, late of the beautiful Niagara, has turned his back on Buffalo and with his young bride has departed for New York. We are all very sorry to lose him and wish him the best of good fortune. W. S.

Floral Designs.

It is often noted that every florist has his own peculiar style in the arrangement of flowers and in a collection of designs one familiar with the work of the various florists in the vicinity can readily indicate the name of the arranger of each piece. We are too apt to get into ruts and work with mechanical precision, building a design much as a carpenter builds a house, and when our favorite materials are lacking we are sadly handicapped. We need to rub up our ideas and get away from the conventional forms that have fastened themselves upon us.

This fact was recently impressed on my mind by an excellent deviation from established rule brought about by stress of circumstances.

An order was left in the evening for a pillow to be delivered early the next morning at an hour that debarred me from any chance to obtain fresh material, and my stock was very low. I had only a few roses and 100 short stemmed carnations, and a quantity of fancy ferns. It seemed impossible to turn out a creditable piece of work with this material, but with many misgivings I went ahead. The pillow being mossed I stemmed enough fancy ferns for an edging, these were about nine inches long and somewhat spread. The small pieces of ferns left were then placed on the surface of the pillow to hide the moss. In the center I massed my white carnations, leaving a band about five inches wide clear around uncovered except by the ferns. On the white carnations I placed the required lettering "Our Father," placing the last word in the center clear across and the

word "our" diagonally over the "F." in "father." On each of the four corners of the pillow I placed a loose spray of Niphetos roses, allowing a few small buds to extend beyond the rest and the effect was excellent. In the space below the inscription a similar loose, naturally arranged spray of Mermets was placed. A few sprays of adiantum and asparagus clipped from plants used to decorated the window, softened the whole. I had left two long stemmed Mermets and these I laid, with full stems extended across the bed of carnations bearing the inscription with a few sprays of adiantum and other foliage, which softened the harsh outlines of the lettering without destroying its legibility, and the arrangement was complete. I placed it in the window where it attracted much favorable comment. The customer was greatly pleased with it, and willingly paid the contract price, \$8, though the cost of all the material was only \$3.25, leaving a profit of \$4.75, which is not a bad profit on an \$8 design. J. F. B.

We request subscribers to make remittance by draft or money order when renewing subscriptions, and to keep a record of the numbers and dates of same. This is to guard against losses in the mails.

Do YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

YOU CAN never invest \$2 to better advantage than in a copy of our trade directory and reference book.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

Knowledge in the Seed Trade.

BY E. V. HALLOCK.

[Read before Seedsmen's Session Hort. Congress, Chicago, August 17, 1895.]

You have heard Mr. Gregory on "Comity." He shows us how pleasant, useful and necessary it is. But comity is one clasp to the jewel case of knowledge. It lays before us in social intercourse much experience of others, a cold, sticky and stony field to work in, but tilled by some much more than by others, and when worked too much is seldom worked at a profit. It lays before us many ideas lying cold and fruitless in many heads, but when put together, like a skillful chemist, produce wonders. It lays before us a knowledge of the men who mould and put their impress on their trade. This imprint of character is stronger than we think. When the last crusaders sailed away from Syria a strange stillness settled over the land. When Napoleon was taken out of France all Europe sat as enchanted without aims. If the firms of Vilmorin, Benary, Deppe, Hurst and Carter, Thorburn and Landreth, Henderson and Burpee, Gregory and Ferry were sponged out of our trade we would feel a great inanition overcome us. Our zest of emulation would vanish, our enthusiasm would ooze out, in fact we would be treading a strange world, and our vanity would not sustain us.

We are told that nature, like the sphinx who sat by the roadside propounding her riddles to passersby (which if they could not answer she destroyed), is of womanly celestial loveliness and tenderness, the face and bosom of a goddess, but ending in claws and the body of a lioness. Of each man she asks daily, in mild voice, yet with terrible significance, "Knowest thou the meaning of this day? What thou canst do to-day wisely attempt to do." Answer her riddle, it is well with thee. Pass on regarding it not, it will answer itself. The solution for thee is a thing of teeth and claws. To read aright, not alone the technical details of our business, but the past, present and above all, and right here sits the sphinx—the future drift and trend of both men and things is necessary to succeed. By my little "Knowledge in the Seed Trade" I intended to convey a much broader meaning than knowledge of the business; the latter speaks more particularly of things, while the former includes both men and things. The latter would indicate that you were well up in knowing how long a certain seed was good, how to put up five pounds of radish seed and have the bag square and nice. To answer the customer who asks "How much cabbage seed do I need to plant an acre?" (which is usually answered about as correctly as the question asked by the man from Florida on a winter visit to St. Paul when he asks "When shall I plant this tomato seed?") That you know without asking to give the house-wife a wax bean that rusts a little, and the market gardener one that holds its color and don't rust, even if it has a fiddle string on either side of it and is pronounced by him to be the best in the world. In fact a thorough knowledge of the business is more than most of us possess, but knowledge in the business is a "shoreless sea."

A seedsman of to-day must know how

to advertise by drummer, newspaper and catalogue. There are diamonds in the earth as fine as any ever taken out of it, but they are hard to find, they do not advertise. Some seedsmen are not hard to find, but find it hard to make people believe them when found. He must know how to get up a catalogue—simple names and prices seem no longer to do—he must wake up the men he wants to sell to by stimulating his imagination and capidity by well turned descriptions, and perchance by well drawn illustrations, which perhaps will be as large as life and a little more natural. You must at all events arouse in him energy and hopes enough to send you an order, and curiosity enough to include some novelty in the purchase. A seedsman of to-day has many kinds of customers. He has cash customers who always want a few extras and novelties thrown in, and generally get them. He has credit customers and some that never pay. Retail and wholesale customers in the south, north, east and west; in all these localities occur market gardeners for local markets. Shippers for long distances, specialists, cannery, kitchen gardeners, etc. When he sells to the trade in these localities he must even know what their customers want. When a market gardener or shipper from Mobile or Kalamazoo sends for a Flat Dutch Cabbage you must know what particular strain is suited to his soil and market. One market wants a flat podded bean, another a round pod; one market wants a red potato, one a white. Men on clay land, men on sandy land, market gardeners south and north ask him to send them seed. To distribute seed that will suit the requirements of all these men and places is a test of an able seedsman.

In regard to credits alone he must exercise great judgment of men and circumstances. Some states to induce settlement, and to protect the small and poor land owner, have made their exemption clauses so large and elastic that they can be made to cover a claim of almost any size; he has boomers with small capital and large credits, poor men with good intentions, people who tell him a pitiful story to get his seed, another who says his seed is no good to keep his money.

He must know the stocks of all growers to a nicety, to get a strain of carrots from one, a beet from another, a radish from France, a lettuce from California. North for this, south for that. It is so now he must keep track of the changes and improvements of stocks that growers make from time to time.

It is necessary to know where the climatic conditions best meet the requirements of each particular seed. This was not thought necessary a few years ago, as many growers forced a product of many kinds in one locality. But competition and annihilation of distance by cheap transportation and knowledge of climatic conditions by some make it necessary for all. I would take the tuberose as an illustration of this. Less than twenty years ago more were imported from France than grown here, twelve years ago 99% were grown north of latitude 40° at probably an average cost of \$15 per 1,000, with a selling price of \$20. But I know many years when the cost exceeded the selling price. Now 99% are produced below latitude 35° at probably a cost of \$6 per 1,000, with seldom a failure of crop. Still it took 6,000 years to find this out. Price of land, cost of labor also enter into the question largely. In the case of the tuberose, climate, cost of land and labor were all favorable.

Again in California, where we find the most favorable soil and climatic conditions, we also find land worth \$500 per acre, and labor rather uncertain.

He must also know the staple stocks of the principal dealers, so when his contracts and stocks from regular sources run out he will know where to buy when this trade requires from other seedsmen. And here we come to a place where inside knowledge is valuable, we know dealers who are whole souled sociable men, whom we like to meet, but whose stock we would not touch with a ten foot pole at any price. Others who are arbitrary and disagreeable, but whose stock we will have at any price. Candor and confidence comes in here also, if we know our man, and he tells us so and so, we don't mind paying for it, if we are sure to get what we buy. An old German woman with a striking business men came to us one day for carrot seed. Planting herself in front of the salesman, with arms akimbo, dress and sleeves rolled up, she says, "How much for Danvers carrot seed?" She was told 60 cents and a very fine stock for \$1.25; with a startling suddenness she asks, "Do I get the \$1.25 seed if I pay for it?" We got her \$1.25 per pound anyway. And here is what we are all wanting to know, do we get what we pay for.

Knowledge is a barrier to fraud. Men who from straightened circumstances will misrepresent in order to make a sale, men who don't care what they sell as a rule, are deterred from doing so when they know the buyer is master of his business. There was a time when many foreign and domestic dealers traded on the ignorance of the buyer, but I warn all who are so disposed, that that time is past; most of our domestic growers and dealers know it, and I warn all foreign dealers and growers that we are beyond that point when we *don't know* what we buy, even if we are so very new. I will further say that many dealers here can refer to their test books and tell you how each particular stock of the foreign grower and dealer compare with each other, and with the growers and dealers of this country. Without going into any closer comparison, I will say to our foreign brothers, that we are coming on fast.

In conclusion, will say, that in times past a customer expected each particular seedsman he bought of to tell him his seed "was the best in the world," of course he did not believe it, but it was a sort of soothing balm he had become familiar with. Not so now, you must not only know how good your seed is, but you must know *just how poor it is*. To tell your customer this seed is not just what you would like to give him, that it will germinate so and so, that the quality is not quite up to your best, but is the best you have left, and probably as good as he can get, will do. To tell him it is your best when it is not, is ruinous;—to tell him you *don't know* is worse; it breeds distrust in your customer's mind forever afterwards. He will take seed a little off grade if he knows about how much, but he will never take seed you *don't know about*. A seed, like the children of the earth, to be respected must know its parents. Candor and knowledge are the greatest qualifications of a seedsman.

To our friends from abroad—we welcome you, we wish you could stay longer. You see Europe's hereditary enemies of a thousand years standing, camping, commingling and intermarrying, and living in brotherly love on our open prairies and broad acres. Enemies at home, friends here. People from all climes and nations

DUTCH BULBS.

A full stock now ready. Very close rates on DUTCH HYACINTHS in all grades.
LILIUM CANDIDUM, large, plump, solid bulbs, per 100 \$2.75; per 1000 \$23.00.
FREESIAS, clean, large, healthy bulbs, first size \$4.50; select \$7.50 per 1000.
ROMANS, PAPER WHITE NARCISSUS, and a **FULL LINE** of all Fall Stock.
ROSE C. SOUPERT, 2½-inch, fine stuff, per 100 \$3.50; 3½-inch, per 100 \$8.00.
LATANIAS, 4-inch stuff, grown cold, well rooted, 3 to 5 character leaves, ready for 5-inch pots, per dozen, \$4.00; per 100, \$30.00.
PHENIX RECLINATA, 5-inch, good value at doz. \$5.00.

Plant prices are at our Greenhouses.

PANSY, VAUGHAN'S INTERNATIONAL MIXTURE,
 Now Ready, is a World Beater.

Vaughan's Seed Store,
 148 W. Washington St., CHICAGO. 26 Barclay St., NEW YORK.

live here side by side like brothers. And like the mighty ocean that receives the streams and rivers from all lands, some brackish, some dirty, some poisonous, others vile, but when merged in mother ocean they become one and the same. So will the children of all of these nations become one in the great sea of American citizenship. We have had differences no doubt, some of us may have rules that others think only work one way, but we trust with this meeting, and personal acquaintance we make with one another, that all harsh feelings will disappear or give way before a mutual recognition of justice to both sides.

MESSRS. W. A. BURPEE & Co. are making extensive changes and improvements in their office arrangements at their warehouse.

BOSTON.—Jos. Breck & Sons report trade as fully up to the mark this fall, and contrary to expectations collections are better than usual.

EASTERN NEBRASKA seed growers are likely to have full crops of cucumbers, muskmelons and sweet corn. If any shortage it may be in watermelons.

VISITED CHICAGO: H. C. Stahler, with R. Buist; H. H. Harris, with Northrup, Braslan & Goodwin Co.; S. D. Woodruff & Son; Alfred and Fred S. Plant; W. W. Tracy; H. W. Buckbee.

REPORTS on the retail mail trade for the first ten days of September indicate rather light business; excuses for this may be found, but they are, nevertheless, excuses and not business.

PEAS, early wrinkled sorts, are reported very scarce. Radish, truck dealers hold prices high. Onion Red Wethersfield is said to be in good supply, but some whites are short. Fenchstock may help out.

MR. S. F. LEONARD, who is undoubtedly good authority on onion seed in Chicago, thinks our crop estimate of last week considerably too high. He thinks 25,000 will more than cover the entire crop of Cook county of market sets, omitting of course from the estimate, picklers and onions too large for sale as sets.

HENION & HUBBELL, 55 N. Clinton St., Chicago, Ill

Toronto.

The great industrial exhibition is now open, and promises to be a greater success than ever. The horticultural show is certainly the best that has been held as regards stove and greenhouse flowering and foliage plants, palms and ferns, and one is perfectly safe in saying that no city in the United States or Canada, outside of Boston and (perhaps) New York, could put up such a fine lot of plants, and this too with nearly all the plants in the World's Fair exhibit away.

The section calling for the most tastefully arranged table 19x16 feet brought out good competition, the prizes being of decent dimensions (\$100, \$75, \$50 and \$25). Three florists and three public institutions exhibited, Manton Bros., W. J. Laing, J. Cotterill, Reservoir Park (G. Reeves), Central Prison (W. Houston), and Exhibition Park (J. Chambers). The size of these tables makes it possible for a good decorator to spread himself a bit and to show his good specimens off to advantage, but four of the exhibitors stuck to the old time pyramid—high in the middle sloping evenly down to the edges—and the judges awarded three of them the three best prizes. Is it not true that this clipped pyramid was given up for something a little more artistic and tasty? The beauty of fine specimen plants is half thrown away where only the top or one side can be seen. Plants should be allowed to show their characteristic form too. I must say that I was very much surprised and sorry to see the way the prizes were awarded, and with all respect to the other two judges I think that Mr. Foster would have done better if he had been alone; there is no doubt but that it takes some courage to judge alone, and I venture to express the opinion that Mr. Foster is sorry now that he asked for assistance. I believe that the Gardeners' and Florists' Association of this city is almost a unit in favor of a single judge.

Geo. Reeves, of Reservoir Park, was awarded first prize, and there is no doubt it was the best of the pyramids, though a little less color and more green would have improved it. John Cotterill was second with a pyramid of good plants, but here a little more color was wanted. John Chambers, Exhibition Park, was third with another pyramid of splendid plants, but the arrangement not quite up to the mark. W. J. Laing, fourth, with altogether the prettiest arrangement of any, though the plants were not so good, and it wanted a little more color. Manton Bros.' table (not a pyramid) was full of fine healthy grown plants, interspersed with lots of tuberous begonias, and was also very prettily arranged, it wanted a taller palm in the big mound though. It certainly should have had a place. Mr. W. Houston, Central Prison, had a handsome table with some magnificent specimens, but they were not shown to advantage. I hope to send a report of the other exhibits next week.

Mr. H. J. Cole has opened a store in the Rossin House block on King street, and should do a rushing business there. E.

•————NEW YORK.

TO STOTT GARDEN IMPL'T CO., 136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.  
Signed, BOLANZ BROS., Akron, O.

## Fine Asters.

ED. AM. FLORIST:—I herewith send for your inspection a fair sample of what we consider the finest strain of asters, at least in this section. The pink is the Mary Semple, the white Semple's White. It was my good fortune to see Mr. Semple's stock at Bellevue, Pa., and I must confess I have never seen such a beautiful show of asters. I don't know that I am giving away state secrets when I say they are grown in an orchard, on a hillside, in moderately poor soil with little if any fertilizer. The conditions, however, conspire to make them perfect in form and color and free them entirely from the ravages of the black bug and numerous other pests that have totally destroyed many other beds of asters that gave every promise of fine flowers. Mr. Semple may be pardoned for the jealous care with which he looks after his favorite stock. N. PATTERSON.

Pittsburg.

[The flowers are certainly grand. The pink is a very taking shade, reminding one of that shown by Lillian B. Bird chrysanthemum when at its best. The flowers average three and one-half inches in diameter, and are on stems from twelve to fifteen inches long, each clothed with handsome foliage. We imagine they would be hard to beat.—Ed.]

THE AMERICAN FLORIST and *Gardening* together to one address for \$1.75. Send orders to the American Florist Co.

Newport, R. I.

The Newport Horticultural Society held a picnic on September 6. The society secured a large grove where there was a dancing pavilion and all the requirements that go to make up a first class picnic. The sale of tickets was limited to the members of the society and their friends. The attendance was about three hundred people, including several prominent politicians of the state.

The attractions were numerous, consisting of a base ball game, cricket, tug of war match, quoits, throwing the heavy hammer and various other amusements. For the entertainment of those that went out on the early drags the committee secured the services of a popular song and dance comedian.

The base ball game was captained by two popular gardeners, namely, "Jack Allan" and "Joe Gibson." Joe Gibson had secured the services of a celebrated pitcher and the score stood 7 to 2 in favor of his nine.

There was no regular cricket match on, but there were a great many present who had played the game when in the "old country," and hadn't forgotten how to handle the bat and they seemed to thoroughly enjoy this sport. The tug of war match between the married and single men was well contested, the single men winning in the best two out of three.

After the base ball game a regular good old fashioned Rhode Island clam-bake dinner was served, which apparently was very much enjoyed by all present. The dancing pavilion had at all times a good attendance, and from the merry peals of laughter and shouting therein there was no doubt that this part of the program was being thoroughly enjoyed.

This was the second annual "outing" of the society and it was pronounced a grand success in every respect.

#### Neighborly Courtesies.

A postal card bearing the following was recently received by the superintendent of a certain State Fair.

To the Superintendent of the Horticultural Exhibition; Dear Sir:—If Mrs. S— shows Gladioluses at your fair she stole them. She took them from my garden without my knowledge or permission. Yours truly, Mrs. A—.

SAN FRANCISCO.—Paul W. A. Grallert and Chas. Fick have formed a partnership under the title of Grallert & Co., and have rented greenhouses at Colma, where they will grow cut flowers and plants for the San Francisco market, making a specialty of carnations.

THE National Chrysanthemum Society of England held its first show September 5, which was of course devoted to the earliest bloomers. First-class certificates were awarded to two new sorts, Mr. E. Rowbottom, a yellow Japanese, very pure in color, and Samuel Barlow, medium sized Japanese, deep salmon pink, with center shading to yellow. Among the varieties shown Mme. Desgrange in its several forms was extensively represented. Etoile de Lyon, La Vierge, Puritan, and Mrs. Irving Clarke received commendation. September 5 would give little material for a chrysanthemum show here.

THE AMERICAN FLORIST and Gardening together to one address for \$1.75. Send orders to the American Florist Co.

### Decorative Plants for the Western Trade.

Among Chicago florists who handle decorative plants of a high order Mr. J. T. Anthony, president-elect of the S. A. F., may justly be regarded as a pioneer. He is really the only Chicago grower who handles orchids for cut flower purposes, and his ferns, palms and other foliage plants are in advance of the usual line. His flowers, roses and all general material for cutting are to be grown at his new place at Bowmanville. A recent visit to his Prairie avenue establishment showed a batch of unusually fine rubbers.

"This foliage is unusually good; how have you carried them through the summer?" was asked of Mr. Boehm, the foreman.

"They have only recently been brought inside, since the cold nights set in. We kept them outside all summer; it is fine for rubbers."

"They are very nicely branched; what do you do to get that habit?"

"Nothing but take cuttings from the tip whenever we are ready for them. Most of these nice plants have given us a good crop of cuttings this season, and they are all breaking very freely."

"You have but few of the variegated rubber; don't you like it?"

"It is a beautiful thing, and just as easy to propagate as the ordinary type, but the leaves soon turn brown or spotted and lose their good looks. Even a good plant will often have several bad leaves at the bottom, and this ruins the appearance of the plant."

"You have a good lot of Pandanus Veitchii here, but I don't notice any utilis."

"No, we find Veitchii more salable; it is much handsomer to begin with and it stands better; it is one of the very best house plants we sell."

"Your plants are very well colored; how did you treat them during the summer?"

"They were in a house covered with oiled muslin instead of glass, one of the houses stripped by the hail storm last May. They have only been glazed within a few weeks, and the palms and pandanus did very well under the cloth."

"Then you don't summer your palms outside as well as the rubbers?"

"No, it wouldn't be safe here; the only palms we can trust outside are a few of the hardiest, phoenix, chamaerops, etc. But the palms did admirably under the muslin."

"You have a fine stock of Latania borbonica; do you still find it a standard palm? In some of the eastern cities we are told it is hardly as salable as the kentias."

"Yes, it is always in demand; shapely plants with five to seven leaves are always useful stock. The kentia is perhaps better in some respects; it is more graceful as a small plant and stands bet-

ter in a dark place, but it does not seem ahead of the latania in public favor. We find plenty of use for the larger kentias for decorative purposes."

Several of the palm houses contained a good lot of Adiantum cuneatum in fine order; certainly the most useful of all ferns for cutting. They were recently potted in a good loam with a fair admixture of charcoal.

"You don't seem to have your adiantum for cutting planted out on the benches."

"No, it takes up too much room, and is far easier handled in pots. You see we have a good deal of cuneatum for cutting, as well as decorative purposes, but we use less of it in fern pans than we do the harder varieties."

"You seem to have more ferns in 2 and 3-inch pots than any larger size."

"Yes, by the time they get into 4-inch they are too large for our purposes. We shall use up a large quantity of this small stock during the next two months in fern pans and boxes."

"Here is Pteris Victoriae; how do you like it. We have heard some remark that it is not a very good trade fern, being very brittle and showing little of its character when small."

"It may not suit the wholesaler, but we find it excellent for the retail trade. The color is very distinct and shows well even on these little specimens, as you see. By the time it makes fertile fronds it is of course too big for our usual purpose, but the color on the young fronds is quite distinct, and handsomer than P. cretica albo-lineata. Of other pterises we use a quantity of tremula and cretica, as you see; both are very useful."

"Here is a distinct and robust little fern, with the shining dark green pinnæ and black stems."

"That is a very useful thing; Doryopteris palmata, or Pteris palmata, as it is now called. A large specimen of it is very handsome, and when small it is as useful as the others of its family for fern pans."

"Neprolepis exaltata is evidently a useful thing, judging from the amount you grow."

"Yes, it would be hard to fill its place. In the summer it is used in veranda boxes and vases, and in the winter it is a salable house plant. It is so easily propagated too from the rhizomes."

All the ferns in Mr. Anthony's place are just these characteristic useful sorts found salable in a retail trade, and the pteris appears to hold first place. Adiantums are almost confined to cuneatum, this being the only variety in quantity. Onychium japonicum is of course present; it is one of the ever-useful sorts and is so graceful when of small size. Most of the ferns are grown on side benches in the palm houses, where they are near the light, and find a congenial temperature. Selaginellas are hardly seen at all; some half dozen very pretty plants of a slender

arborescent variety, name unknown, were noted, but as Mr. Boehm remarked, they take so long to grow to an attractive size that they are not suited to commercial use. Still, for a Wardian case there are few prettier plants than some of the selaginellas. Some pretty little cocos, six to ten inches high, were noted; these are used entirely in the fern pans, they being of little use when larger.

A group of beautifully variegated plants, ivory white and rich green, was next approached; it was *Phrynium variegatum*.

"That is a very beautiful thing, and uncommon too; I judge it is useful in decorating."

"It is," responded Mr. Boehm. "It is a handsome thing, and very easy to propagate, like a maranta; in fact some people erroneously insist it is a maranta, in spite of the difference in structure. It is a very useful thing."

"You evidently find no trouble in propagating marantas."

"No, it is no trouble to make them grow. We use a lot of *M. Kerchoveana* (?), this variety with satiny green leaves marked with black; it runs along very rapidly and is a very handy thing, being so close and dwarf in habit, either for fern pans or for a close border in decorations."

*M. Bachemiana*, or more properly *Calathea Bachemiana*, is another useful sort, and so is *Calathea Makoyana*, deep green, blotched with creamy yellow and white, and *C. Massangana*, olive, marked with silver and velvety maroon. A number of the plants we used to know as marantas are now classed as calatheas.

A few plants of *Araucaria excelsa* stood in another house, but they are not yet appreciated in Chicago. On learning the price would-be purchasers are apt to remark that they are nothing but pine trees, and sales are few and far between.

Mr. Anthony has a nice batch of Chinese primroses coming on; he finds this a very salable plant when well grown and in good bloom, and the quantity used is increasing. Cinerarias too were potted up in the same house as the primulas, but they are not so much called for in this establishment. Chrysanthemums are looking well, a fact discovered by a few hungry grasshoppers, who have lost their bearings and wandered down Prairie avenue. The flowering stuff is, however, at Bowmanville.

Of orchids there was nothing in flower at this time; the stock consists of the well known and free flowering varieties of cattleyas, lalias, oncidiums, odontoglossums, cyripediums, cecylogynes, etc. Mr. Anthony says the taste for orchid flowers is certainly growing in the Chicago market; the most fastidious buyers demand them, and the demand will become greater as people learn the supply can be depended upon.

#### Seasonable Hints.

The time has come round again for housing our field grown plants. A few growers have already filled their houses, others are at work doing so, but many prefer to leave the plants in the field till the end of September or middle of October. Our first articles of this series went

into particulars on this point. We would simply refer those desiring information to them.

This brings to mind what seems to be a generally accepted opinion, viz., that all plants (carnations in particular) are necessarily subjected to unnatural and uncongenial conditions when housed under glass. If we allow this idea to prevail we are very apt to ascribe our failures to it, whereas they are more likely to result from our own carelessness and incompetence. Perhaps in a general sense the assertion is true, for of course plants do not grow under glass in a state of nature. In the same sense it is not natural that men should live in fine houses surrounded by the luxuries of civilization. The natural man was about as wild as the natural carnation. Civilized man is eminently suited to his environment, and supplants the native races. The improved and highly bred carnation of to-day is as well suited to its surroundings. So much so that our present stock would soon degenerate if allowed to have their own way in a state of nature. A properly constructed greenhouse establishment is the most suitable and natural place in the world for growing carnations as we know them to day. History does not record when the first pink was cultivated. They are said to grow wild in some parts of the world; but it is very probable in such cases they have escaped from cultivation with the inevitable degeneration. The carnation may be classed with the cereals and many fruits which have been the product of high cultivation from time which antedates history. They are the result of man's skill, and one of the conditions for their successful production, in this latitude at least, is the glass house. There need be no artificial condition about it. Properly cared for—tenderly, lovingly as we would our own children—they will reward us with a bountiful crop of flowers. The unnatural part of greenhouse culture is neglect, inexperience, ignorance, carelessness, laziness. Let us avoid these stumbling blocks and perseverance will direct us to success.

Avondale, Pa. W. R. SHIELMIRE.

#### Carnation Notes.

For many years Hinze's White has been the favorite white carnation with Messrs. E. Wienhoeber & Co., Chicago, though of late years they have also grown Silver Spray largely. Now, after keeping a careful record of returns from each variety for several years, Mr. Buettner finds that Silver Spray is considerably the most profitable, and for the coming winter his stock is nearly all of the Silver Spray, retaining only one bench of the Hinze's. The only fault he has to find with Silver Spray is that the first crop of flowers are rather small, with numerous buds. But he cuts these with long stems, taking buds and all, and after that he gets good sized flowers on nice clean stems.

He is going to give Lizzie McGowan a further trial this season, but is not favorably impressed with it thus far. Last season he got few good flowers, nearly all being burst or otherwise imperfect.

Grace Wilder has always done exceedingly well with him. He relates a curious experience with this variety. One year he purchased two lots of rooted cuttings of this sort, one from the originator and the other from another grower. The lot from the originator all bore the fine pink blooms that give Wilder its reputation, while those from the other lot were

streaky and washy. Both lots were on the same bench and received identical treatment. The difference in the flowers was so marked that it could be seen at a glance where one lot of plants ended and the other began. He feels certain that both lots were Wilder and believes that the good lot of plants were from cuttings taken from vigorous plants, while the others had been rooted from weak wood from plants that had been crowded to produce lots of cuttings without regard to quality. He propagated his following season's stock from the plants bearing the good flowers, throwing the others away, and has had first-class stock ever since. He never has any streaky or washy flowers. He is cutting good flowers now from the old benches that have borne steadily all last winter and this summer; also from similar benches of Silver Spray and Portia. He used to grow stock specially for summer blooming, but now finds this unnecessary.

The terrible drouth has militated seriously against the growth of carnations in the field, and being unable to properly water all the plants outside, he has about half of them already benched in the houses.

#### Crimson Clover to Plow Under.

ED. AM. FLORIST:—In your issue of September 7 the report of the meeting of the Chester County Carnation Society will, I am afraid, be rather misleading in regard to the use of the Italian or crimson clover (*Trifolium incarnatum*) as a green crop to turn under. As printed, the report says that the seed sown early in October will make a crop ready to turn under in November. Instead of the latter month I should have said the first of May.

The value of this crop to the carnation grower is that the seed can be sown as soon as the carnations are out of the ground, say by the 15th to the 20th of October, and if it can get a fairly good start will continue to grow all winter whenever the ground is not frozen. Early in the spring it starts to grow very luxuriantly, and by the time the ground needs to be plowed for setting out the young plants in the spring there will be a heavy mass of foliage to turn under, as with us this clover is just coming into full bloom, furnishing abundant vegetable matter for use in connection with commercial fertilizers, making a great saving where stable manure is scarce or expensive, both in cash and in labor.

It is practically a stolen crop, growing when the ground would otherwise be idle. Unless overgrown with that pest of old carnation ground, the chickweed, it occupies the ground to the exclusion of weeds, and being plowed down early casts no seed of its own to become a troublesome weed later in the season.

When the carnations are removed the ground should be well worked up with a cultivator, the seed broadcasted and well rolled in, and it will need no further attention until plowed under in the spring. To secure a thick stand when sown as late as the middle of October at least 20 pounds of seed per acre should be sown.

E. D. DARLINGTON.

Fordhook Farm, Doylestown, Pa.

VASES AND VERANDA BOXES.

## Veranda Boxes and Vases.

The illustration is from a photograph of a typical Delaware avenue residence. Many such are to be seen on that beautiful avenue of Buffalo. It is illustrated to show where the veranda boxes are suitable. Were they to run the entire front of the house the writer thinks it would be overdone. The veranda box seen is 36 feet long. There are two very handsome tubs of *Hydrangea Otaksa* and several iron vases of mixed plants scattered round in suitable places. There are no iron or wooden fences to keep the public "off the grass." The pedestrians of all classes appreciate the beauty of such places, and *do* keep off the grass.

Buffalo, N. Y.

WM. SCOTT.

## Verbena Venosa and Colors Harmonious With It.

This dainty verbena has a beautiful purple hue which is a charming companion to any pale yellow. I mention two distinct colors, purple and pale yellow, and these it must be confessed are indefinite so far as their names are concerned until we are absolutely sure of what we mean.

I mean by purple the color in the prism which is half way between blue and red. The *Verbena venosa* is that color, but a bit paler than it ought to be. Under my magnifying glass I find that the tiny blossom is crimson-purple in the depths of its cup, and quite pure purple at the

edge of the petal. The effect of the flowers out in the sunshine is still pure purple; indoors the color loses little of its exactness but considerable of its brilliancy. I mean by pale yellow a reduction (by white) of the prismatic yellow, and that is best represented by the palest yellow we can find in *eschscholtzias*, wild mustard and *portulacca*, not by the yellow of the *Pearl nasturtium*.

I can see at once the delicate yellowish tinge of the *Madame Salleroi* geranium is a harmonious color with the purple of the *Verbena venosa*; and the *Pearl nasturtium* with its pale straw yellow inclined toward the buff tone is correspondingly harmonious. But I also notice that the purer and paler the yellow is, which is placed beside the verbena, the better the color harmony.

I have a *calendula* in my garden which is nearly white with a sunflower-yellow center; this is the sweetest harmony of two yellows I know of, and it also produces a charming harmony with the *Verbena venosa*. My *calendula* must not be confounded with the variety called the Proust, because the color in the latter is not the color I am seeking to make plain to our eyes. I am talking about a yellow purer and paler than that we find in the *Pearl nasturtium*, and the Proust's yellow is not the one.

Abstractly speaking, yellow and purple are complementary colors; that is to say, one fulfills the requirements of the other. But a strong purple and a violent yellow are not the most agreeable companions

for each other. I think, therefore, that the pure yellow marigold is not quite companionable to the purple verbena; whereas the light yellow *gladiolus* is. Pluck a bit of deep colored *beliotrope* and place it beside a pale yellow *gladiolus* and the fact is demonstrated at once. The proper course to pursue with yellow and purple is to make one light if the other is rich in hue, and vice versa.

I have nothing to say about massing the *Verbena venosa* in a definite shape of color on either a lawn or in the garden beds. A bed of this beautiful verbena confined to a figure of color which is more or less qualified by an adjacent harmonious or inharmonious color is a subject on which an artist would best not express an opinion. I believe in building up and not tearing down. My impression is that there are numberless combinations of flowers which are more satisfactory than one would suppose if they are put on trial. Any coleus with red on its leaf is no fit companion for purple flowers. Magenta pink is a near relative of purple, and so is purple-blue. I must express an entire disinclination to like any of the principles now practiced upon flower beds. When I see a star or circle of red coleus banded by six inches depth of dusty millers I have nothing to say. I would have just as little to say if the red coleus was replaced by the purple verbena, and even a band of yellow flowers substituted for the silver gray of the dusty miller. What I do believe in is artistic freedom, and that is not consistent with colored

stars and circles made of flowers. Why is it not better to plant the purple verbenas near yellow flowers, regardless of shaped beds where colors must define figures? The fact is, we are not content nowadays to do *simple* things; we are not content with planting white and pink silene between purple verbenas and heliotropes. There are gray lichen-covered rocks, too, which are particularly adapted in color tone to offset dusty millers and ruddy coleus; yet we clear out all such rubbish as rocks and stones from our gardens, work hard to gain a broad green spreading lawn, and then deliberately spot it over with flower beds of set geometrical shapes.

The *Verbena venosa's* purple beauty I am confident is not best seen this way. I myself would be much relieved to see a few tall yellow gladioli springing upward from a monotonous mass of purple flowers. Then, too, if there was so much purple that the color was conspicuous I would prefer to see it broken up into groups, each one of which should be varied with some play of color besides the purple. Monotony in the flower garden should not be tolerated.

F. SCHUYLER MATHEWS.

Seasonable Hints.

Now is the time to get everything in order for the winter. Planting should be over and plants staked and tied. If you have not done so yet all the houses should be thoroughly cleaned under the benches and all rubbish taken out so as to leave no harbor for insects. Walks should be scraped and surfaced with sand or fine ashes, so as to make a good clean walk when wet. All roofs gone over and all broken glass replaced, all loose squares taken out and reset and the roof made tight for winter. If you have any cracked or leaky pipes now is the time to repair them; do not leave them until you want to start your fires and then have to wait a week or so until the boiler men get ready to come, for they are always rushed with work at this season. Your manure for mulching should be under cover in the soil shed and turned over at intervals to get it thoroughly decomposed and friable. Get your soil for potting your young stock mixed and under cover in the shed before it gets soaked with the fall rains. And it is the season to get your soil for next season's planting; make up the soil heap now so as to give the sod a chance to decompose during the winter. All the young plants in the houses should be in active growth now and require constant attention. As the nights are cool now the houses require little if any air at night and your syringing must be done early in the day so as to have the houses and foliage free from too much moisture at night; if too wet the houses get a damp cold atmosphere that is sure to breed mildew. The air must be given sparingly until the sun gets well up in the morning, and must be reduced early in the afternoon so as to avoid too much draft in the houses. Mildew must be fought as soon as a speck appears; it is a good plan to exam-

ine every house daily and give sulphur wherever a spot is seen, and by this means it can be kept from spreading. If green fly appears fumigate; you can do it better now than when a crop is on, and besides by keeping it down now you can almost do away with it altogether in winter by (after the fires are started) putting tobacco stems on the hot water pipes and on the walks. All the plants should be constantly gone over and kept tied up and all bad leaves picked off, all the weak buds should be cut off and the plants encouraged to make as much growth as possible. It is a poor policy to let the young plants flower too soon; better to sacrifice flowers now and try to get as much growth as possible to enable the plants to stand the winter's work. Be sure to keep the surface of the beds clean and stirred, or rubbed over with the hand at least once every ten days, or if your soil is inclined to get green or mossy on the surface, oftener. In fact at this season the rose wants all the attention possible, for the time of preparation for winter is nearly over, and if not well prepared to meet it half the season is lost before you can cut a good paying crop.

Madison, N. J.

JAS. S. TAPLIN.

### OBITUARY.

We announce with regret the death of M. Charles Verdier, of Paris, the well known rosarian. M. Verdier introduced a considerable list of roses, and was greatly esteemed both in horticultural circles and in private life.

#### The Advancement of Floriculture.

Referring to the various essays on means of advancing the interests of floriculture read before the S. A. F. at St. Louis, Mr. James MacPherson writes us that to make it possible for men of ideas to put their projects into execution it will be necessary for florists to secure positions on the public park and garden boards and see to it that only capable men are employed as superintendents, and when a capable man is in charge that he be not hampered or controlled by a lot of cheap politicians.

This is an excellent suggestion, and opens a new avenue of usefulness to the various Florists' Clubs. If the parks and gardens of your city are suffering through political methods let every member of the club join hands, regardless of political affiliation, and strike together for reform. Individuals can do but little in most cases, but an organized body can do much, and the membership of the various clubs is now so large that each one represents a sufficient number of votes to win a champion for their cause among the politicians looking for an issue by the espousal of which they may hoist themselves up another step of the political ladder. And get one of the leading daily papers to take the matter up. But be sure to give the editor the proper lines to work on and keep him supplied with material with which to flay the guilty officials.

Much may be done in this line by even one or two active men. We know of a recent case in which one man with but slight assistance set in motion a force that defeated a strong organized gang in one of our large cities who had decided that one of their number must succeed the thoroughly capable man then in charge of an important public park. It appeared that the gang had two of the five members of the board of managers solid and a pretty good grip on a third one, so good a grip that he had practi-

cally given his consent. The man we spoke of belonged to the same political party that the pirates in question had attached themselves to and he at once placed the facts before the editor of the leading daily organ of the party, with all the corroborative evidence he could collect. As a result the broadminded editor of this great paper wrote a letter to the weak commissioner giving him warning that if the superintendent was removed his paper would make a searching investigation of all alleged causes of such removal and would publish prominently the facts, whatever they might be, and regardless of their political complexion. The next day the superintendent was assured by this commissioner that he could count on him in any emergency. He had been completely converted by this presentation of the case. Politicians are hardened to criticism by papers of opposite political faith, but they are slow to court it from the organs of their own party.

Where the interests of floriculture are in danger from the "practical politician" of any party the trade organizations should meet it shoulder to shoulder, opposing their political power and that of their friends (which they will always find numerous and influential in such cases) against that brought to bear by the opposition, and if they do this with vigor and pertinacity they are pretty sure to win.

#### Hanging Baskets.

The hanging baskets illustrated are of wire lined with green moss and are 12 inches in diameter (across the top). The writer has found no other hanging baskets so satisfactory as these; the roots penetrate into the moss, and they can be given more water, with less care, than either a wooden or earthen ware basket. The baskets pictured were hanging from a veranda, but were removed from this position and suspended against a wall for photographing.

As it is impossible to distinguish each individual plant in the plate I give below a list of all the plants used in the four baskets.

Drooping plants: *Abutilon vexillarium*, money vine, *lophospermum*, *senecio*, variegated and green *vinca*, *Lobelia gracilis*, *nasturtium*, ivy geranium, single *petunia*, variegated *glechoma*.

Upright growing plants: Geraniums in variety (short jointed free flowering varieties are much the best for the purpose), coleus in variety, three varieties of *achyranthes*, *antithericum* (California soap plant), Mt. of Snow and bronze geraniums, *fuchsias* (when location is shady), and several *begonias* (including the rex type). Nothing is more effective than the latter if the baskets have partial shade.

WM. SCOTT.

Buffalo.

#### Miscellaneous Seasonable Hints.

There are several useful bedding plants that it is not necessary to put in cuttings of in the fall as you do many things, and among them is *Santolina incana*, the silvery white of which is indispensable where good carpet bedding is carried out. Lift a few good plants after the other things are killed by frost (*santolina* is almost hardy), put them into 4-inch pots and stand them in the coldest house. After New Year's cut off the tops of the shoots and they break out with hundreds of young tender growths which root very readily. I think from twenty old

HANGING BASKETS.

plants you can get easily 1000 young plants. When rooted I put five or six in a 2-inch pot and about April 1st shake them out and pot singly in a 2-inch pot and put them in a hotbed where they quickly make fine plants.

Don't propagate the white pyrethrum (feverfew) now. Lift a few old plants and later on put in the tips of the leading shoots and from the stems you will get plenty of side shoots for cuttings.

Petunias don't root as easily as most things and unless you have some varieties of extraordinary merit it does not pay to winter any of them over for eight months. Seeds of petunia can now be bought that you can depend on producing fine flowers both double and single, and much time and space can be saved.

*Echeveria secunda glauca*, and the sempervivums, will not be injured by a degree or two of frost, but don't let them stay out too long. Have some flats ready of convenient size and not more than two inches deep, press the soil firmly and dibble in the little plants almost touching; you don't want any soil with them and but an inch or so of root. If you want to increase your stock of this succulent then sort them before boxing into different sizes and have each size by itself. You don't want these plants to grow much during the winter, so a shelf in a very cool house is a good place for them and in the dark weather they will thrive without water.

As soon as your carnations are settled in the benches don't forget to plant a few dozen each along the side of the benches of double sweet alyssum and myosotis (forget me not); both are most useful and are clear profit, as I have failed to see where

they did the slightest damage or robbed the carnations of anything.

Hollyhocks for next summer's flowers should now be in 3-inch pots and in a cold frame, which should be well protected in winter. If not you had better keep them in the coolest house you have.

Seedling pansies should be all planted in cold frames by this time. Press them firmly into the soil and give them a good soaking. They want no shade, for no plant undergoes a transplanting so finely as a pansy. Don't put the sash on till November or the approach of severe frost.

As soon as the *Lilium longiflorum* arrive get them into pots at once, as you have no time to spare. Easter is earlier this year (somewhere in March) than we shall see again in a hundred years, so you will want all the time you have to get the longiflorums into flower. Last year I put three bulbs in a 7-inch pot, first sorting them and putting three bulbs of the same size in each pot, then they grew about an equal height and flowered at the same time. These sold well and were preferred every time over a five or six foot Bermuda at double the price.

The strongest and best cyclamens that were sown early last winter will now be ready for their flowering pot, with me a 5-inch. Any light house will do for them now, but in winter, when they are flowering, they thrive best in a night temperature of 55°. Drain well with broken charcoal and a bit of green moss, and syringe them every fine day. Greenfly is a terrible enemy (or rather they like him) of the cyclamen, so put them in a house where you are not afraid of tobacco smoke.

That useful begonia, *incarnata grandiflora*, that was propagated in late spring will now want its last shift, into a 4, or if strong, 5-inch pot. Don't give them any more shade, don't use too rich a soil, and by all means don't over-water them or they will get a rust that will render them useless.

I have not noticed any carnation specialist writing about carnation plants for spring sales. Since the carnation has been such a popular plant the demand for carnation plants for a mixed border has greatly increased and in many cases the order is poorly filled. Our practice is, after the planting of the houses is done, to lift all that remain in the field. They will be sure to be the smallest plants and all the better for that. Pinch off all flowering and leading shoots and pot firmly into 4 or 5-inch pots and plunge in cold frame. Keep close and shaded for a week; after that give all the air you can; take the sashes off entirely on fine days. Very little attention is needed during the winter. If a long thaw and warm days come they can be given a watering sufficient to keep them from wilting. In April they are brought indoors, and by selling time are most satisfactory plants. I have found old Garfield good for this purpose, and so is Grace Wilder, and Puritan, from its habit, should be a fine white for the purpose. I protect the sides of the frames with straw manure and use double sash during the coldest months. The sooner they are lifted the better they will winter.

Buffalo, Sept. 18, '93. WM. SCOTT.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser.

## Fire Insurance.

I am well pleased to see the matter of greenhouse fire insurance agitated, and a committee appointed to receive reports of the insurance carried by the trade. It is the duty of every florist to respond promptly to the request of the committee, for if this business is handled rightly many dollars can be saved individually and in the aggregate many thousands. Until about ten years ago I paid 75 cents per \$100 on buildings and stock equally divided. Then Buffalo was visited by a number of disastrous fires, mostly among large business houses. It was a regular epidemic. Whether the whole country suffered I have forgotten. Then our underwriters met and the result was insurance rates on business property went up with a jump. Greenhouse rates went from 75 cents to \$1.80 per hundred. The florists here have kicked but in vain; I have repeatedly shown the agents what I considered the absolute safety of my place, but they say they can't help it; is the board's decree and the board don't see any difference. A greenhouse is a greenhouse. Fancy the difference. They will insure a rickety wooden dwelling, perforated with stove pipes through wooden partitions, coal oil lamps, etc., for 75 cents per hundred and the policy covers three years. If they would not insure the stock I would let insurance go, and I was once told by Mr. Burton of Chestnut Hill that their companies would not insure the stock. If it is the average of loss they grade their rates by then it has been a very profitable business in this county. In my recollection I can remember but one loss in twenty years and that was on a very small house not worth more than \$200, and the loss on stock paid by the insurance company was \$600, and that was no accident, it was a clear case of burning up for the insurance. The company or its agents was ashamed of the amount they had insured the stock for and instead of putting the little man in the state's prison they paid the money and let it drop. It seems to me we ought to insist on the greenhouse structures being examined and graded according to risk of fire there is about their construction. If there are any left of those old fashioned flue heated rabbit hutches which are called greenhouses, they should pay five times the premium of many of the modern finely built establishments where the steam boiler is in a stone or brick building entirely detached from the houses, or even a good hot water boiler in a brick lined stovehole and a good brick chimney. Then again should the man who has a fire hydrant within fifteen feet of his front door and a fire engine of the latest and best pattern within three hundred yards of his place and ten of them within two miles, pay as much as the man whose houses are in a small village and who in case of fire breaking out would have nothing but a village hand engine or nothing at all to depend on? It is a rich man who can afford to go without fire insurance, but the rates are in most places exorbitant and are felt as a heavy tax on the poor florist's income.

What's the matter with a mutual fire insurance company confined entirely to greenhouse structures the same as the hail insurance? It would be a bigger thing than the hail perhaps, but such fire insurance does exist locally, among farmers for instance, and I know of one farmer's company in western New York that is a great success. No fires, no assessments. It would work as well as hail insurance. Insure a man's place for only two-thirds

of the actual value and there would be no incentive to have a fire. WM. SCOTT.  
Buffalo.

## Vase of Tuberous Begonias.

This is a bronze iron vase, 3 feet 6 inches high and 22 inches in diameter, filled with tuberous rooted begonias. It is in partial shade only, but the vase has been one of the most satisfactory and admired among thousands. It was filled about June 5 with small plants, none of which were in flower at the time. There are fifteen plants in the vase.

Buffalo. WM. SCOTT.

## Philadelphia.

Griffen Bros., of Frankford, have been particularly successful with asters in pots, their stock being as a whole the finest we have ever seen. It goes without saying they have no trouble in disposing of them.

The cool evenings seem to remind the growers that the stock outside must soon be housed, and quite a number of houses intended to be only temporary, which however become so useful that they develop into permanent structures, are now going up.

George Anderson is erecting two to stay, for George doesn't believe in doing things in any half way manner. His roses look very well, but he has not cut any as yet, preferring to pinch the buds off for a while longer.

Although Mr. Harris' place is larger than ever, he says that it will be difficult for him to find room to properly store his stock. In speaking of carnations Mr. Harris says while some varieties have not made much growth with him the past summer, Edna Craig is an exception, and has proved itself to be one of the strongest growers he has yet seen.

The first sale of plants in New York from the "Celebrated Philadelphia establishments," as the notice of sale puts it, will be a large one and the stock to be offered first-class in every respect; it being from Messrs. Harris, Craig, Lonsdale and Burton, is a sufficient guarantee as to quality.

Robert Craig has some of the finest *Nephrolepis davalloides* ferns, that have been seen for many a day. Some specimens measure five feet in diameter and three feet high; they are in 10-inch pans.

Z. De Forest Ely & Co. have added a new department to their business, that of florist's supplies. They say: "So many of our customers for bulbs and seeds have sent us orders in this line that we have decided to add it to our general business." We understand that David Cliffe of Germantown is to have charge of this department.

Business is getting better but is very fitful, one day being good and encouraging the dealer to lay in a stock, and the next being such as to make him wish he hadn't.

Prices of roses are about the same as last week, carnations are getting a shade better and good ones sell readily for \$1 per hundred. Valley is scarce, not much being raised about here; 4 to 5 is asked for good sprays. Smilax is plenty at 15 to 18, asparagus 60 to 75, tuberose and gladiolus 2.50 to 3 per hundred stalks. Kaiserin can now be had in moderate quantities. Burton, Lonsdale and Craig are all sending it in. It is beginning to come a fair size with a good stem, but the color is somewhat disappointing for a white rose, it so far resembling Mme. Hoste in this respect. We are assured

however that it will come to its true color, a creamy white, as the season advances.

Stories of people being poisoned from eating what they supposed were good mushrooms, are appearing in the public press and have alarmed timid folks and set them talking about the danger of eating this delicious esculent. The truth of the matter is, and we have this on the authority of George M. Watson, (the M. stands for mushroom), that the people who were poisoned did not eat good mushrooms but a variety which grows in the pastures along with them, and which is poisonous, but in appearance resembles the true mushroom to such an extent that only experts can tell them apart. The safe plan is to handle such stock as comes from regularly prepared spawn and about which there need never be any doubt. Any florist can utilize the waste spaces under his benches in growing mushrooms and in some cases the returns will be found larger for the products that grow under the tables than for the crop next the glass. K.

## Boston.

Cut flower trade is still very dull; roses of all common varieties are exceedingly plenty and prices lower than at any previous corresponding season. Boston is having it something after the New York style. Roses, ordinary varieties in quantity, can be purchased as low as \$5 per thousand. The American Beauty, however, does not suffer here, as there are not enough grown to supply the market, and the greater part of those handled in this vicinity are shipped from New York.

Carnations continue very scarce, and if of good quality will bring as high as \$2 a hundred without urging. The second crop of asters is beginning to appear, and there are indications that the price will be affected accordingly. These late asters, however, are inferior in quality to the main crop.

The exhibition at Horticultural Hall on Saturday, September 16, was exceedingly fine in many respects. Tuberous begonias and pansies are beginning to feel the influence of the fall weather, and are showing up in splendid form. The collection of hardy herbaceous flowers from Shady Hill Nurseries was one of the finest features of the exhibition. The weather seems to have been just right for this class of plants, judging by the flowers shown here recently, which have never been seen in greater brilliancy and general perfection of bloom. Specially beautiful were the hardy asters, among which some of the handsomest were versicolor, Lady Trevelyan, Amellus and Nova Angliae. There was also a very full exhibition of hardy herbaceous flowers from N. T. Kidder. E. Tassinari showed annual phloxes in many new colors, also excellent zinnias. W. C. Winter's exhibition of show dahlias included in all about sixty named varieties, all perfect blooms. Mrs. Fisher carnation, as shown by R. T. Lombard was in excellent form. R. & J. Farquhar staged a large exhibition of cannas, several of which were promising seedlings. Fruit and vegetables were shown extensively, peaches, corn, tomatoes and cauliflower being shown in unusual perfection.

In the death of Mr. F. L. Ames, the Massachusetts Horticultural Society sustains a serious loss, for he has been an active member of the finance committee for several years, and it will be hard to fill his place. As to Mr. Ames' personal qualities so much has been said in the

BRONZE IRON VASE FILLED WITH TUBEROUS BEGONIAS.

daily papers already that anything further in these notes would be superfluous. It may be said, however, that the praise which has been bestowed upon him has not been overdrawn. The Gardeners' and Florists' Club of Boston, especially those of its members who were entrusted with financial responsibilities at the time of the convention of the Society of American Florists in Boston, have had reason to keep a warm place in their hearts for F. L. Ames, to whom they have always felt a debt of gratitude was due for the kindness which he showed them at that time. It is to be hoped that those who come into possession of that magnificent orchid collection will keep it intact, and will not permit the horticultural glory of North Easton to depart.

George Walter Dawson, son of Jackson Dawson, of the Arnold Arboretum, has been appointed assistant instructor in the art department of the University of Pennsylvania.

The extension of the City Hospital has necessitated the destruction of the city greenhouses. The sum of \$100,000 has been appropriated for the purpose of securing a new location, and advertise-

ments are out soliciting proposals for selling land to the city for nurseries and greenhouses. If a suitable location is obtained new greenhouses will be erected. In the meantime the large number of tropical plants at present in the public grounds will require shelter, and a temporary structure is being erected for that purpose. It has been suggested that \$20,000 or \$30,000 of the "Franklin Fund" be set apart for the benefit of Boston's shade trees. No better disposition of the money could be made.

Arrivals in town: Burt Eddy, of Chicago; W. A. Manda, Short Hills; C. B. Weathered, New York.

#### New York.

Cut flower trade is at a standstill. Roses are improving in quality and increasing in quantity. Mermets and Brides are particularly good. American Beauty and Meteor are in full supply. Carnations continue scarce. Single violets are beginning to come in and sell fairly well at 15 to 25. Garden stock is abundant; a severe frost is necessary.

Fleishman's new store on Broadway was opened and special invitations issued

for Monday evening, the 18th inst. There were very handsome wall decorations and electric lighting. This adds another to the number of magnificent Broadway stores, and Mr. F. will doubtless get his share of trade.

Philadelphia growers had an auction sale of palms, rubbers, etc. Tuesday, the 19th inst. There was a large crowd of buyers and prices were fully up to the mark.

Mr. Geo. H. Linsdale, of 23rd street and Lexington avenue, mourns the loss of his mother, who died on the 9th inst.

Mr. C. Harrison Brown, bookkeeper for Thorley, was married on September 6 to Miss Augusta Pliss at St. Luke's Methodist Church.

#### Chicago.

At the last meeting of the Florist Club a committee was appointed to prepare suitable resolutions regarding the loss to the club by the death of Nicholas Singler, an old and much respected member of the club.

By the way, the club has adopted a mourning badge to be worn by members when attending the funeral of a deceased brother member of the club. These were first worn at the funeral of Mr. Singler.

The president was instructed to appoint at his leisure a committee to formulate a plan for the gathering together and compilation of statistics regarding the amount of cut flower producing plants housed for the coming season's work. An attempt will be made to secure reports from every large grower for the Chicago market as to the number of plants of each variety of rose, carnation, etc. he will grow the coming season, these to be compiled together and thus give an idea of what may be expected in the way of supply and in what direction there is apt to be a shortage or oversupply. It is believed that, while shortages and gluts are sure to occur, by securing exact knowledge of what the producers as a whole are doing they may be lessened to some extent and a saving of expense and labor be made thereby. An attempt will also be made to secure approximate figures as to the amount of stock of each sort disposed of and the amount of same produced, but not disposed of, during the season. A similar record for the following year will throw a strong light on the direction in which supply and demand are tending and thereby prevent considerable waste. It is an attempt to substitute an exact and accurate record for the guesswork which is now the growers' only reliance.

There was some talk of resuming the monthly suppers, but it was finally decided to wait till cooler weather, and a proposition that the first one be held during the chrysanthemum show met with universal favor.

The Cut Flower Exchange is doing exceedingly well. There has been only 50% called in on the stock and now the stockholders are assured that not only will there be no further assessments, but that dividends may soon be looked for.

Mr. Hubert Mass, financial secretary of the Florist Club, is soon to be a Benedict. We congratulate the fair one that has made this excellent capture.

W. A. Viberts, who recently returned from Minneapolis, is making arrangements to go into business on his own account in this city.

The market shows some improvement over last week, though trade is still rather quiet. Prices are firmer, though not advanced. Most flowers are improving in

quality. Some of the roses, Brides, Mer-mets and Meteors, have been showing a little mildew, the result of the late cold nights. La France, Perles and Beauties are generally good. Carnations are improving. Many growers have been lifting their plants, as the only way of saving them in consequence of the prolonged drouth. The dry spell, however, was broken at last by a heavy rain on Sunday night, which was very welcome, though it comes too late to save much of the outdoor stuff. This class of material is very scarce; tuberose, late gladiolus, dahlias, cosmos, etc., are all scorched and burnt, and late asters have suffered severely from the grasshoppers. This scarcity of outdoor material is likely to be felt in the market.

T. J. Corbrey has given up his store on West Madison street, being succeeded there by Miss Corbrey. He will in future devote himself entirely to the commission business.

Among recent visitors to Chicago were Mr. and Mrs. Lewis Ulrich, Tiffin, Ohio; Geo. E. Fancourt, Wilkesbarre, Pa.; A. Schmitt, Glenville, Ohio; Richard Horstman, Berlin, Germany; J. Borland, A. Borland, Kalamazoo, Mich.; T. J. Ludwig, Columbus, Ohio; H. Ericksen, St. Paul, Minn.; Jno. Krumholz, Detroit, Mich.; Hans Hansen, A. E. Wohler, Altoona, Pa.; U. J. Virgin, Wm. Rehm, New Orleans, La.; A. C. Brown, Springfield, Ill.; Harry Bunyard, Short Hills, N. J.; W. W. Coles, Kokomo, Ind.

#### St. Louis.

Trade during the past week continued fair. The receipts still continue to be heavier than at this time in former seasons. No change of any consequence is looked for until some time next month, when the cool weather begins to make itself felt. The weather has been very variable, we having had the warmest day of the season and also the coolest night so far.

The regular monthly meeting of the Florists' Club was held last Thursday and was the occasion for the officers elected for the ensuing year to take their positions. They were Alex Waldbart, president; Julius Koenig, vice-president; Emil Schray, secretary; and Fred C. Weber, treasurer. The board of trustees consists of Julius Benecke, C. A. Kuehn and F. Ostertag. As all of the above are hard working members the club may safely look forward to a prosperous year under their guidance.

A sort of hitch was met with in regard to having music at the chrysanthemum show. It appears that the musical union embracing most all the musicians in the city will not let any less than twenty performers appear in the "grand music hall" in which the flower show is held. The privilege of paying for the music under their estimate was not sufficiently appreciated by club members, so a committee was appointed to look for something not quite so expensive.

A communication from the teachers' committee was read regarding the offering of admission cards for prizes to the various classes in the public schools of the city. While they recognized the educational features of the show and the desirability of extending the love for flowers and plants among the children, they were forced to discourage the project owing to its being an opening whereby the schools could be used as a means of advertising.

A scheme has been perfected, however, with one of the leading papers whereby they present to every want advertiser in

their issue of the Saturday and Sunday preceding the opening a card of admission. They will give the club the face value of the tickets used in advertising and in addition will make a special point of having the fact understood that chrysanthemum tickets will be given to advertisers in certain editions. This advertising will be incidental and will be fully, if not more, effective than that returned directly for the tickets. This scheme met with the approval of the members present and the sum of \$200 was allowed to cover the cost of tickets to be used.

Notice was given of the offering of three special prizes by private parties. The amounts were two of \$25 and one of \$15. The classes in which they are to be offered have not yet been decided, but probably will be as soon as the exhibition committee meet. The probabilities are one will be for cut roses, another for cut carnations and the third for chrysanthemum plants. It was decided also to call for cut flowers in the seedling chrysanthemum class, owing to the difficulty of getting a good showing of plants; as it now stands it calls for three flowers of a kind.

Mr. Benton of Hanft & Benton, formerly of the firm of Benton & Lindenbrink, is to be married on the 25th of the present month, and has the congratulations and best wishes of a large circle of friends.

Notice has been issued by Stacius Kehrmann, receiver for the Elleard Floral Co., stating that he will hear and allow claims against the company on October 16, 17 and 18 respectively.

Joe Rolker is in town looking for people who are in the market for bulbs, and incidentally wants to know why bulbs are not "in it." R. F. T.

#### Toronto.

The Industrial Exhibition just about to close has been a most immense success this year both as regards attendance and the show itself. Several days this week the turnstiles registered 75,000. It is under the direction of a paid manager who has made it the most successful annual fair on the continent. There is a fair sized horticultural building, but it is rather dark and not altogether suitable. It is to be hoped that the directors will soon see their way to put up a building in accordance with the requirements for a first-class floral exhibition. So far the horses and cattle have been receiving all the attention, and they are now housed as comfortably as when they are at home.

The show of ferns in all sections is very good, the "50 in 3-inch pots 25 varieties" bringing out six competitors, all of whom had pretty collections; the competition in the larger sections was also very keen.

The flowering, stove and greenhouse plants made a fine show and pleased the ladies and the visitors generally who always want to see flowers.

The palms big and little were also good, though the biggest are away, and filled up a large space.

Stove and greenhouse foliage plants were perhaps smaller than usual though healthy and well grown; the largest plants were all in the tables 19x16 feet which I mentioned last week.

The exhibit of cut flowers and designs which were judged as usual by friend Scott of Buffalo was very large, but I was unable owing to the crowd to take notes of the individual exhibits. The gladioli seemed to be especially fine and large, some of Mr. Gilchrist's hybrids being

particularly noticeable amongst the rest.

Fruits and vegetables were simply immense and many of them will figure on the tables at the World's Fair in a short time.

There is a large bed of canna Mme. Crozy just outside the horticultural building, just a mass of bloom now, and one can imagine what the big beds at Chicago must be like. All the flower beds in the Exhibition Park are very fine this season, better than usual, which is saying a good deal.

Trade has been a little better during the exhibition, but it is merely a flash in the pan, the real thing won't begin until after a good hard frost spoils the outdoor flowers and plants.

Many professional friends from the country have been in town this week and altogether things have been lively enough to cheer the heart of a confirmed pessimist. E.

#### Baltimore.

Trade continues much the same. Good flowers find a ready market at fair prices. There is no appearance of a glut, and yet, except at very rare intervals, every one seems able to get what he wants with little trouble. The Hebrew New Year swept the market pretty clean of rose buds and made quite a stir in flowers generally, but only for a day, and then things relapsed to a customary quiescence.

The only matter that provoked very serious discussion at the club meeting was the report that a florist hitherto considered a very respectable member of the trade had adopted the practice of "crape pulling," i. e., soliciting orders for flowers and designs from houses wherever the crape at the door indicates a recent death. The members of the club present seemed unanimous in denouncing the practice, which tends to lower the standing of the trade in the eyes of the community, and would probably eventually do away with the custom of having flowers at funerals altogether.

Another question that attracted considerable interest and which was discussed by a number of the members was that of insuring greenhouses against loss by fire. In the discussion it was shown that the experience of the members was that fire insurance on greenhouses was hard to obtain, and the premiums charged were exorbitant in comparison with the charges for other buildings. After considerable debate, all of which went to show that very unjust and unreasonable discrimination was made by the insurance companies against greenhouses, the following resolution offered by Secretary McRoberts was adopted without a negative vote:

*Resolved*, that it is the sense of this club that a mutual fire insurance for greenhouses on the plan of the Hail Insurance is very desirable, and we would urge the Society of American Florists to take the matter into consideration and if possible elaborate such a scheme.

MACK.

#### Pittsfield, Mass.

The eighty-fourth annual fair of the Berkshire Agricultural Society was held at the Fair Grounds in this city on September 12, 13, 14, 15. The horticultural display was shown in a large tent in the same manner as last year, but for some reason the professional element kept aloof, and with the exception of a fine group of decorative plants and a large collection of vegetables from Col. Walter

DREER'S DISPLAY OF FERNS IN THE PENNSYLVANIA EXHIBIT AT THE WORLD'S FAIR

Cutting, the president of the society, the displays of cut flowers, plants, etc. were contributed entirely by small amateurs.

Since the successful establishment of the annual chrysanthemum show under the auspices of the Gardeners and Florists' Club there is an inclination among the gardeners to confine their efforts to this one exhibition, and this fact, added to the lack of inducements in the way of suitable premiums or a practical schedule on the part of the Agricultural Society's management has resulted as above stated, namely, in the entire absence of the professional gardeners from any representation in the horticultural department of the fair.

In the cut flower display were to be seen the usual monstrosities in the way of floral designs constructed from the product of the home gardens. Asters and pansies, however, were shown in quality equal to the best professional growing. Some of the pansies were especially fine, considering the extremely dry weather which has prevailed in this section. On the second day the show was greatly improved by the arrival of a large collection of new and striking decorative plants from Pitcher & Manda. Diplomas of merit were awarded by the judges to the following plants shown in this collection: *Araucaria excelsa compacta*,

*Aphelandra Roezlii*, *Begonia Madame Lennett* and *Geonoma Pohlana*.

There is plenty of material and plenty of ability in Berkshire county to put up an exhibition equal to the best in any part of the country. It only requires a little wise management to accomplish it, and the Berkshire Agricultural Society will make a serious mistake if it does not recognize this fact and act upon it.

#### A Visit to Chicago.

##### A TRUE STORY.

The Philadelphia delegation had started for St. Louis and I was left at home, feeling lonely and despondent. True, I might easily have gone with them, the reasons for staying at home, then so strong, now seemed mere excuses. Finally I could stand it no longer and packing my grip started for the train. It was too late for the convention, so Chicago was my objective point. Besides the Fair with its many attractions there were the parks full of elaborate mosaic beds and choice shrubbery, the greenhouses in the vicinity and last, but by no means least, I wished to visit Kokomo, Indiana, and see whether Mr. Coles had really found that rose soil for which he explored Chestnut Hill in vain.

The journey proved delightful and was over all too soon. A sudden impulse

seized me. Before going to the Fair grounds I would see Mr. J. T. Anthony and his greenhouses. I did not then know of the honor which had been thrust on Mr. Anthony, but he had won my esteem while we were on a committee together at Washington last year, by his fearless denunciation of certain fancy boilers.

To Mr. Anthony's I went and found that great man seated in the doorway of one of his greenhouses. His greeting was cordial and in response to my inquiry how things were looking he waved me past him into a house about 150 feet long. I was startled. Never before have I seen such a beautiful houseful of plants. The center table was entirely filled with specimens of *Salvia splendens* in 8-inch pots, superbly grown. The leaves were as regular, lustrous and almost as large as those of a *Spherogyne latifolia*; the flower spikes were long and perfect, each floret of a brilliant scarlet that would shame even a Crozy canna; the whole were the perfection of decorative plants.

Mr. Anthony said he had produced this wonderful result by careful hybridizing, and volunteered to sell me three ounces of the seed at \$9 per ounce! For an instant I hesitated, but remembering Mr. Harris and his lilies and Mr. Burton and his arecas I accepted his offer and left with visions of future success. As I

crossed the street with the precious package under my arm some one called to me, I awoke and found it was nearly time to begin another day's work.

The improved scarlet sage is still undiscovered.

JOHN WELSH YOUNG.

Germantown, Phila.

### Foreign Notes.

*Nymphaea Laydekeri* var. *rosea* is now in bloom in the water lily house at Kew Botanic Gardens, where it has received much praise. It will be remembered that this new *Nymphaea* has been blooming in Mr. Tricker's display at the World's Fair, where it is in the open air.

M. Edouard Andre, the distinguished French landscape gardener, has recently received his appointment as Chevalier of the Order of Leopold. M. Andre, who is one of the editors of the *Revue Horticole*, is author of a standard work on landscape gardening and a professor in the National School of Horticulture at Versailles.

M. Latour-Marliac, to whom we are indebted for so many beautiful hybrid *Nymphaeas*, has recently sent out several new ones. Among these are *N. Marliacca ignea*, with deep purple red flowers, and *N. M. rubra punctata*, the color rosy red in innumerable tiny dots, over a lighter ground. Another is a soft salmon color with yellow center. These are likely to prove valuable acquisitions.

Cactus dahlias appear to be growing in popularity abroad; among fine sorts recently shown at a London show were *Lady Penzance*, rich yellow; *Countess of Radnor*, salmon, yellow center; *Chancellor*, crimson purple; *Bertha Mawley*, crimson and magenta, distinct; *Countess of Gosford*, reddish brown, center yellow.

A new China rose which made a good impression at the last show of the Royal Horticultural Society in London is *Duke of York*, a bright crimson, said to be very free and distinct. It seems likely to prove a useful variety.

The National Dahlia Society of England held its annual show at the Crystal Palace September 1 and 2. The exhibits were divided into show, fancy, cactus, pompon and single dahlias, and the exhibits were numerous. A number of fine seedlings were shown.

### SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

## The Seed Trade.

## AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

A. W. LIVINGSTON'S SONS made a fine display of vegetables and seeds at the Iowa State Fair September 1.

IT IS UNDERSTOOD that a committee of the Seedsmen's League will take action upon the shortage of crops with a view of agreeing upon uniform prices.

OUR types made us use the word *seed* for the word *sets* in an item referring to the latter in our last issue. The real meaning was, we trust, not misunderstood.

VISITED CHICAGO: H. A. Johns of Sioux City, M. Kurtzweil of the Iowa Seed Co., R. A. Robbins, J. Comont, R. B. Stevens of Cleveland Seed Co., S. B. Dicks, with Cooper, Taber & Co.; U. J. Virgin of New Orleans.

## Department of Agriculture Seed Notes.

An innovation which Secretary Morton purposed trying was to invite seedsmen to bid openly for the general supply of seeds, but it was found upon a personal examination by an agent of the department who traveled among the seedsmen, that they could not calculate well enough what their crops would be and consequently they would not bid. The competition which was expected, however, has caused the cost of seeds to the department to be decreased about one-quarter. Another innovation still is the proposition, which is already seriously made, to replace all the women who pack the seeds with machines. There is said to be a very successful one in use by seedsmen and it is proposed to try this. If it should prove successful one machine would do the work of eighteen women, and the cost, as it is estimated, would be about six cents a thousand packages for putting them up instead of from two to three dollars a thousand as now. The introduction of these machines would mean the permanent discharge, of course, of an average of 100 to 150 women, and while this might seem like a hardship to them, it is also to be observed that there are a great many deserving people who have never enjoyed a chance to work for the department at all. IOWA HOMESTEAD.

## Bouvardias.

In No. 276 of the FLORIST Mr. Scott, in his very useful and instructive seasonable hints, says that the bouvardia is useful, but hardly profitable. Now, I beg to differ with him on the not profitable part, for I have found it one of the most useful and all-the-year-round flowers you can raise. I used to only grow the *Bride* and *Davisonii*, and for the retail trade they can't be beat, for a good bed of bouvardia is mighty useful when you have a lot of funeral work on hand; on account of its lightness and delicacy it lightens up a heavy piece better than any small flower you can use. The *Bride* is such a soft pink it harmonizes with almost any other flower, and for solid white work *Davisonii* gives it an appearance of lightness that a solid white design seldom possesses. Bouvardia cut in the early morning and dipped in water and then shaken out and placed with the stems in water is a good keeping flower, even in hot weather. I

**DUTCH BULBS.** A full stock now ready. Very close rates on DUTCH HYACINTHS in all grades.

NEW CROP SEED, per ¼ oz. \$1.50; oz. \$10.00. Also separate colors in great assortment.

## Vaughan's Seed Store,

148 W. Washington St., CHICAGO. 26 Barclay St., NEW YORK.

always got the best flowers from two year old plants; then you can if you wish it cut panicles of flowers with stems from one foot to eighteen inches in length, and it sells well. The double flowered varieties I do not like, and they do not get as long stems or as good trusses as the two above mentioned varieties. I do not believe in planting them in benches; give them a solid bed and they pay.

In commencing with your root cuttings don't put in any that have mealy bug at the root; put them in about February or early in March and pot off in thumbs. As soon as there is no risk of frost, say May fifteenth, plant in light rich land, using plenty of manure, and keep the plants well pinched back till after mid-summer, and then you will have plants two feet high, with ten or a dozen good shoots. Make a solid bed same as an old style rose bed, using light fibrous loam, mixed with at least a third well decayed manure; plant about fourteen inches from plant to plant, and stake and tie as soon as planted. Water it in well and syringe several times a day, until plants take hold. If the plants are dry when taken up, dip the balls before planting. Towards spring mulch the same as roses. About July cut half the bed back to six inches of the surface, stir up and top-dress with a mulch composed of half soil and half manure. As soon as it begins to flower cut back the rest, and then you have it in flower at all times, and the second winter it will give you enormous crops of flower.

Old plants can not be carried over on a bench satisfactorily, as it is next to impossible to keep them moist, and if allowed to get dry it is always hard and spidery. Cutting back also keeps down mealy bug, which is very partial to bouvardias, and when planting any that have bug at the roots should not be used. Treated this way and given plenty of water without being allowed to get sodden at the root, and the house kept at a night temperature of not less than 60°, you will find it useful and profitable.

Madison, N. J. JAS. S. TAPLIN.

## "Mexican Roses."

Last spring a fakir sold a good many packages of "Mexican rose" seed to people in Pittsburg. The seed that germinated has produced the plain, everyday mustard and the victims are now very wroth.

## How can we Best Elevate our Profession?

Among the several able essays read before the St. Louis convention those read by Messrs. Robert Craig and Geo. C. Watson held my attention the closest from the fact that I expected to find my hobby incorporated in one or the other. But to my surprise both gentlemen overlooked it, no doubt unintentionally. To increase the love of flowers among the people is in my opinion not a difficult problem. Mr. Craig says most of us have not fully improved our opportunities in this respect; we cannot do too much in making our own home surroundings attractive with flowers, and thus give our patrons ideas of what may be done. Mr. Watson lays great stress upon exhibitions. This is all very well, but how both gentlemen omitted the greenhouses puzzles me.

What a disappointment to many, who, after viewing the home surroundings and the exhibitions, go to the greenhouses to see where these plants are grown and seek a little information that we are always ready to give. There they are first treated to heaps of rubbish during wet weather or in a thaw to mud ankle deep, break neck steps, and the worst of all, dirty slushy walks. How many of us have not, while showing ladies around, seen them hesitate on account of disgraceful walks and finally see them give it up with the remark, "Oh, I should think it would be to your interest to keep your place fit for visitors! Who can take any pleasure in walking through these houses?" And how many have dirty, rotten sheds that they call an office, with not even a chair to offer a lady who prefers to wait there while her order is being filled.

In the four years that I have been engaged in this delightful occupation, I regret to say my observation is that there is a large degree of unpardonable slovenliness, lack of taste and pride among those in the business. I came from the farm, and am sure I can point out in ten miles square more tidily and orderly kept farms than I can florists' establishments. And one other thing I give a thorough farmer credit for—he prefers an intelligent and neat employe to a cheap tramp and makes a distinction between a common, careless hand and a reliable, respectable one. In this I find many florists entirely different. It is especially so below the Mason and Dixon line. There black and white, tramp and otherwise, are always on a parity. To accomplish what these learned florists advocated before the convention can in my opinion never be until floriculture is lifted up in this respect.

It seems to me if one of these gentlemen had chosen this subject, "How can we best elevate our profession," he would have started a breeze that would eventually develop into a wind that would blow this profession a great amount of good. The first move of every florist should be to maintain a neat, attractive front to his establishment; order and neatness should also prevail inside. Some say it does not pay; I hold that it does pay. People like to visit greenhouses, and it pays to show them around, too, the rich and the plain alike. The next move should be in the direction of a more intelligent class of help.

I sometimes think what I would do if I were an employer. In the first place I would hire only intelligent and polite young men. Then I would treat them as such. Each one would, I am certain, have been of sufficient profit to me at the end of the year to deserve a Christmas

## PANSIES.

## THE BEST ARE THE CHEAPEST.

My customers say that mine are the best they can buy in all that goes to make good Pansies, **size, color, form and substance.** Try them, and you will say so yourself. They are better this season than ever, and if you don't want more, get a hundred for comparison with others you grow.

The **Plants** are good as well as the strain, and for the asking I will mail you an honest sample. Price free by mail 75 cts. per 100, or \$3.00 per 500; by express \$5.00 per 1000. 50,000 ready to ship every week from now until Dec. 1st.

L. B. 496.

ALBERT M. HERR, LANCASTER, PA.

ZIRNGIEBEL'S  
Giant Market and Giant Fancy  
PANSIES,

are without question the most popular strains in cultivation up to date.

New Seed ready now, in trade packages of either strain, at one dollar each.

## PLANTS FOR SALE.

Denys Zirngiebel,  
NEEDHAM, MASS.

present to the amount of one dollar; this I would convert into a subscription to the AMERICAN FLORIST. Then I would pay as I agreed, either by the week or by the month, and not let men go two or three months without a cent. And if I sent a manifesto to my colleagues in regard to attending the convention I would not only say "Let's all go," but also "Let's all pay our hands before we go." It is the height of injustice for an employer to let his men go two months without a cent and go to the convention and cut a swell with their wages.

P. D. GATTON.

[Our correspondent has certainly drawn a very unattractive picture. We know that there are such places as he has described, but we question whether they are in the majority at the present time. They are a relic of the past and where they do exist their owners are being rapidly pushed to the wall by the enterprising men who constitute the backbone of the trade to-day.—Ed.]

SPRINGFIELD, O.—The Good & Reese Co.'s new range of houses are nearing completion and are said by all who have seen them to be models in every detail. Locust posts and cypress lumber were used. The benches are covered with 3/4-inch thick slate. Size of glass 16x24. Ventilating done by the Champion Automatic Machine. The heating will be by steam, half being placed overhead and half under the staging. Three of the houses are 20x225 and three of them 20x100. These additional houses gives them probably the largest glass area in the west, none of it being over three years old. The firm makes a specialty of growing rose plants and claims to be the largest growers of them in America.

BAY CITY, MICH.—Albert G. Boehringer, formerly at the Michigan State Agricultural College, and his brother, Rudolph G. Boehringer, have entered into partnership under the firm name of Boehringer Bros., and will conduct a florist business. They are building two greenhouses, each 18x75.

When writing to any of the advertisers on this page please mention the AMERICAN FLORIST.

## PANSIES WORTH RAISING.

The kind that Sell at Sight.

## TRADE DIRECTORY

AMERICAN FLORIST CO., CHICAGO

## Springfield, Mass.

The begonia show of the Hampden County Hort. Society was very successful. The tuberous begonia exhibit occupied about 50 feet of the floor space. Of this 24 was taken by the exhibit of F. R. Belden, who showed about 40 varieties. Among Mr. Belden's begonias were several seedlings which were planted in February and which had 60 per cent of double flowers. From the conservatories of the late John E. Taylor were 27 varieties of tuberous begonias, beside a handsome gloxinia, two shrubby begonias and seven handsome specimens of the begonia rex. The largest exhibit in the hall was the fine collection of asters, dahlias, gladiolus, euphorbia and phlox shown by L. D. Boyington. Other noteworthy exhibits were the asters and gladiolus shown by L. D. Robinson, six bouquets from Edward Cook, miscellaneous exhibit from Rev. W. T. Hutchins, gladiolus and fruited branch of new cherry crab-apple from J. W. Adams & Co., dahlias and fuchsia from C. L. Simons, Appoline rose from A. M. Grant, and fine specimens of 10 varieties of grapes grown by R. H. Smith.

## Canna Paul Marquant.

Mr. L. B. Coddington, of Atlanta, Ga., writes that he recently observed a big block of this canna growing on the grounds of the F. R. Pierson Co., at Scarborough, N. Y., and that however it may appear at the Fair it leaves nothing to be desired as seen at Scarborough. He was very favorably impressed with the variety, and believes it has even a better constitution than Mme. Crozy.

PROVIDENCE, R. I.—The Rhode Island Horticultural Society held a successful aster and dahlia show on Saturday, September 9. The exhibition was a magnificent one and attracted a large assemblage of visitors. One of the largest exhibitors was Wm. H. Tarbox of Crompton who showed over two thousand asters and three hundred and fifty dahlias, in almost endless variety. Among the notable visitors in the afternoon was Dr. Mary Walker, who seemed to enjoy the exhibition greatly. In addition to the flowers, there was quite an extensive display of fruits and vegetables.

CLINTON, MASS.—The Amateur Horticultural Society held their annual exhibition on the afternoon and evening of September 9. The exhibition was very satisfactory and was considered a great success by the members. This is a young society and the present is its first public exhibition. Among the exhibitors were E. W. Breed of Clinton and G. F. Chandler of South Lancaster. The judges were C. T. Fletcher, John Clark and E. O. Orpet, all private gardeners on the Thayer estates in Lancaster.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Mention the American Florist when  
writing to advertisers on this page.

Marblehead, Mass.

The third annual flower show was held at Abbott Hall on August 31. The exhibition was as good, if not better than its predecessors. The attendance was larger than ever before. There were over two hundred exhibitors. In asters alone there were seventy-eight exhibitors, and there were seventy-five entries for the bouquet premiums. The participants were mainly amateurs, and the flowers came from their home gardens. One could scarcely believe that the rocky gardens and close quarters of old Marblehead could produce such a display. Mr. Wm. Craff, the largest exhibitor, is a shoe cutter in one of the factories, and he and his wife are enthusiasts in flower culture.

The "amateur" was seen in many of the vases of flowers, bouquets, etc., in the arrangement and grouping and general finish, but the exhibits were far in advance of former ones, and self-education is apparent all through.

The idea of these shows originated in the seed warehouse of J. J. H. Gregory & Son, Mr. Gregory and his chief clerk Mr. Franklin Reynolds, having induced their employees (many of them girls), to compete one year. The result was so satisfactory that they decided to extend the influence by interesting the general public. Such well directed effort cannot but greatly increase the knowledge of and love for flowers and horticultural pursuits among the people, and is worthy of imitation and encouragement in all directions. Mr. E. E. Woodman of Danvers was one of the judges.

## Correction.

On Page 123, last issue, in account of Massachusetts Horticultural Society's exhibition, *Dracena indivisa varieties* should read *Dracena indivisa variegata*.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

**"Something Important."**

Mr. Geo. Thomas of New Orleans sends us a circular with the above heading, which he believes entitled to a place in our humorous column. He says: "It was sent us by an enterprising colored merchant of this city and I send it to you as going to prove that we are trying to keep in line with our go-ahead northern brethren." Following is the body of the circular:

Why do human beings compare with varieties in considering our some plants? I am compelled to agree with the subject. But yet some plants outlive people, because they are cared for in the beginning, while many neglect to care for themselves. The care of a plant is just the same as the care of a child. In fact, all care is through the mother, and the care of the plant is through the mother. You will ask, who do you call the mother of a plant? Some people do not consider that a plant has a mother. But I say it has a mother in the beginning, and if it had not a mother you would not expect the plants. It has a kind mother who gives the same care as a mother gives her child.

There are plants of different varieties, and the Mother Soil is of different descriptions. If the mother of the Plant is poor and she is unable to give proper nourishment to the plant it is sickly and needs proper nourishing attention. The same with human beings. The soil sometimes gets poor, thin and packed tight. This causes the smother of the plant and if you don't give it proper treatment it will die. In the first place you must have good soil; see that they have proper drainage and not exposed too much to the cold. Can we do without these beautiful sights to our eyes. The five principal senses answer no! The two important senses are in varieties, that is, seeing and smelling. How elegant it is to inhale the fragrance of the atmosphere when we are passing to and fro, which goes into the atmosphere. God gave us the five senses—hearing, seeing, tasting, feeling and smelling—and when we are without one of them we are miserable. The same is with a plant; the senses are given to plants and the beginning is from the mother, which is the Soil.

There are many kinds of plants that live in dead wood and rocks and in many different kinds of soil. What can anyone expect of a plant without cultivation? We need cultivation. It is just the same with a plant.

I am prepared to furnish Soil for any variety of every description and will prove it to be the same. I always have different sorts of Soil, such as Leaf mould, Coffee Grounds, Sagnum Moss, Wood Mould and Peat.

MORRIS, ILL.—The Morris Floral Co. has started into business here and built a greenhouse 20x100. A. Mittig is manager.

OWING to illness, Mr. Wm. Scott, of Buffalo, was unable to prepare his usual batch of seasonable notes for this week's issue. He will, in all probability, be on deck again next week.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

### Cannas.

The wonderful advance made in these flowers within a few years, and the large number of varieties already on the market, will cause far-seeing growers to study the ideal for the canna of the future, with a view towards working in that line. It would show a lack of discrimination to keep on producing new varieties, unless they show enough advancement to give them permanence, and indeed there may be many new forms in which they show such a slight advance that their retention, under new names, would only lead to confusion, though such plants would be of great value as breeders.

During a recent interview Mr. Fred Kanst, superintendent of South Park, Chicago, gave us some valuable ideas on this subject. Mr. Kanst has been studying these cannas very closely in the grounds under his care, and being appointed a judge of the canna exhibit at the World's Fair he has naturally given a good deal of attention to the display there. It is Mr. Kanst's opinion that one great object, to be kept in view in growing new varieties, is to produce broader petals. Where the petals are very wide they are likely to overlap a little, and this gives them a greater firmness to resist wind. The flowers are quite tender, as a rule, and where the petals are long and narrow, freely separated, they twist about badly and soon get a battered appearance. Mme. Crozy, which is still one of the very best we have, has this width, the lateral petals often being 1½ inches across. Another excellent thing characteristic of Mme. Crozy, which should be striven for in new varieties, is its habit of making several lateral spikes. By the time the main spike has finished blooming the laterals are in fine condition, and the old main spike can be cut away, while varieties making a single straight stalk, without branching, do not keep such a continuous show of bloom. A strong, robust habit and freedom of bloom must also be secured; some fine sorts, which now take the eye in the World's Fair display, have done so little early in the season that their value was lost. The ideal canna, according to Mr. Kanst's observation, should have a dwarf, compact habit of growth, flower stalks held well up, yet not long enough to appear spindling, flower spikes branching and erect; flowers rather closely set, with very wide firm petals. Judging by this there are few yet superior to Mme. Crozy, and it is fair to take that as a standard. It has a strong, dwarf growth, and is a constant bloomer.

Florence Vaughan. This Mr. Kanst considers the best of its coloring. It has a very strong habit, is a free and continuous bloomer, and is very striking in color. The width of its petals ranges from one to one and one-half inches, and

the color stands well in an exposed situation. Indispensable.

Capt. P. de Suzzoni. The same type as the preceding, but not so striking, nor are the flowers so large. But it is a free and constant bloomer, beginning to flower early, and continuing through the season, and excellent for bedding in masses.

Alphonse Bouvier. This beautiful red is often criticised for one defect, if defect it is; its spike has a slightly drooping tendency. But the flowers are good size, beautiful color and freely produced; it keeps up a constant succession of bloom from the beginning to the end of the season. It is one of the most valuable varieties for continuous effect; it should be watched through the whole season to appreciate its merits.

J. C. Vaughan. This has a very brilliant orange vermilion flower and handsome bronze foliage. Very good. The flower has a rich satiny lustre, making a fine contrast with the foliage.

Egandale. Similar in habit to J. C. Vaughan, but foliage much darker. Flower a soft currant red. Excellent in a collection.

J. D. Cabos. Dark foliage. Flower a very rich orange, tinged with apricot. Good color and a very free bloomer.

Paul Marquant. This is synonymous with Gustave Sennholz, but the name Marquant appears to have the right of priority. Foliage green; flower salmon, with long petals. It is a free bloomer, but the petals are too narrow, and consequently flimsy.

Paul Bruant. Dwarf habit, foliage green, edged with purple. Flower spikes thrown up well above the leaves, flowers orange scarlet, satiny in texture. A free bloomer and good bedder.

Comte Horace de Choiseul. Very dwarf, with close compact habit and good green foliage. Flowers light crimson, in thick spikes, on such short stalks that they are only just even with the leaves. However, the plant itself is so very dwarf and compact that the flowers show well among the leaves.

Francois Crozy. This grows to a height of about three feet. It is a very free bloomer, with orange flowers, but the texture of the flowers is thin, and there are others better.

President Carnot. Foliage dark, flower deep scarlet, inclining to crimson. Does not flower freely enough, and is excelled by others.

Explorateur Cramphel. A good red, but does not flower freely enough to be satisfactory.

Secretary Stewart. Flower bright garnet, foliage green. This is a late bloomer; it has done very little all summer, but is making a good show now. Not so good as others, on account of this defect.

Miss Sarah Hill. This has a good red flower, though not very large, and it is now blooming freely. But it appears very

late here, and has done very little flowering earlier. But with all these cannas, what is said of them here in Chicago may not be the case in other places; good judges who have seen the variety now under discussion in the east say it has bloomed very freely and made a magnificent show.

Admiral Gervais. Flower bright scarlet, bordered with yellow. Dwarf, somewhat after the style of Mme. Crozy, but not so good. Others better.

Charles Henderson. A fine red and very robust, good, but too late. It makes a fine show in the fall, but does very little earlier in the season.

Stadtgartner Sennholz. Poor flower and indifferent color.

Statuaire Fulconis. Red flower, with thin, narrow petals, poor.

Baronne de Renowardy. Rosy salmon, overlaid with scarlet. Fair flower, but not remarkable.

Duke de Montenard. Rich orange, spotted cinnamon red, and Duchess de Montenard, bright yellow, spotted with red, are too near alike: the first named is the best of the two. Neither is remarkable, though of fair quality.

Senator Montefiore. Yellow, streaked with scarlet. Bright flowers, of medium size, produced in great profusion; an extremely prolific bloomer.

It is only fair to say that the summer at the Fair has been an extremely severe test of these cannas. They are plants which, from their luxuriant growth, require an abundance of food and water. At the Fair the soil is extremely poor, and there was a lack of manure. The situation is very exposed, and the plants have suffered from the dry, sweeping winds prevalent all this summer. This has been very hard on both foliage and flower, and only the most robust sorts could be expected to show to advantage. Still, the severity of the test should be a good guide for the selection of varieties for general use. As Mr. Kanst very justly remarks, it is impossible to judge a variety by seeing it at one period of the season only. It must be watched the whole summer through; some of the varieties making the best show now, in the middle of September, did so little blooming earlier as to be very disappointing.

Among the very newest varieties, not yet in commerce, Mr. Kanst gave high praise to Columbia, a new American seedling. The color is a rich red, the flowers large, with very broad petals, borne closely massed on a large spike, with a tendency to lateral branching. This is better than A. Bouvier, which it resembles in color, and is a decided advance. Another named seedling, not yet out, is Germania. This strongly resembles Mme. Crozy, only the color is crimson rather than scarlet, bordered with yellow. The flower is larger than Crozy, and it may be considered an advance, but its similarity to the older variety is likely to cause confusion.

Among new seedlings known by number only Mr. Kanst mentioned Pitcher & Manda's No. 13, which has handsome glaucous foliage and purple stems; flowers brilliant red, streaked crimson. Fine habit and free bloomer.

J. C. Vaughan has a number of good seedlings under number. Among these is No. 120; it has green foliage, glaucous underneath. Flower orange red, faintly spotted all over with little crimson dots. Thick broad petals and large flowers; a decided advance, and very promising, likely to be valuable. No. 118 was another promising sort, growing about

four feet high; it has glaucous green leaves, the stems shaded with crimson. Flowers deep salmon red, shaded with crimson spots over the entire surface. No. 104, with green foliage, has an immense flower, brick red, streaked with crimson. The petals are  $1\frac{1}{2}$  inches wide and three inches long. No. 107 has dazzling light vermillion red flowers, with petals  $1\frac{1}{4}$  inches wide; foliage glaucous green. A very good grower, and a promising acquisition.

It will be noted that throughout this list Mr. Kanst lays special stress on increase in size and substance. He deprecates the introduction of varieties showing but a slight improvement over existing forms, believing that far more valuable results would be obtained if these improvements were used in breeding, until some very marked advance was obtained. There are plenty of possibilities in color, but variation in color would mean little without size, substance and constancy of bloom. To sum up, our ideal canna has flowers with petals one and one-half inches wide and three inches long—this has already been reached—it must have a spike with lateral branching, thus insuring prolonged bloom, like Mme. Crozy; it must bloom constantly, like Bouvier, and have a robust dwarf habit. Flimsiness, either in flower or foliage, must be strongly discouraged. Considering the wonderful advances already made, the future of the canna is very brilliant, and it is without doubt the most popular decorative bedding plant we possess.

Diseases Attacking Roses.

At this season of the year the first thing to consider in this matter is mildew, and a great many people are troubled with it more than there is any occasion for if they attend to the requirements of the case. One of the best preventives of mildew is an abundance of air at all possible times. I mean by this that the temperature should never be allowed to exceed  $60^{\circ}$  in the morning at this season of the year before air is put on, or, in other words, the moment it begins to rise a small portion of air should be put on and gently increased till all air possible is put on for bright warm days, gradually reducing the amount in the afternoon till finally closed. This keeps the plants hardy and at the same time builds up a very much better constitution than the stewing process to which many growers subject their plants, and which is one of the greatest causes of mildew. I am ready and willing to admit that many cases of mildew are produced when almost the counterpart of the above method is followed, but with a humid, warm atmosphere the rushing on a lot of air to reduce the same is one of the surest producers of this trouble.

Where mildew has and seems persistently to keep a foothold there are several means of keeping it in check. We have now reached the season of the year where it seems to be almost necessary to make a small amount of fire at least on all cool nights, and where the houses are heated with steam a small amount of sulphur

and oil mixed and a little placed on the pipes (not a heavy amount enough to kill the plants, but simply a thin coat of this material) will usually keep all mildew in check, because the steam when applied will create sulphuric gas enough in the house to destroy all fungoid growths.

Where hot water is used, if the pipes are valved so that one single pipe can be used in the house (which is really the best way to pipe a house), then that pipe can be made to destroy mildew from this time on; but in cases where no valves have been used in erecting the heating apparatus this is almost impracticable at this season of the year. In the latter case I would advise the application of sulphur to the foliage. Blowing through the ordinary sulphur bellows is the best means of applying it that I know of, and the best time to do it is the early afternoon on a bright sunny day, from three to half past three o'clock. Close the house tight and run up the temperature from  $75^{\circ}$  to  $80^{\circ}$ , fill the house full of sulphur dust and the heat will then generate enough gas to destroy the fungus. Care must be taken next morning about the air as usual. This may possibly have to be done twice a week for some three or four weeks till the weather gets cool enough to apply to pipes as above described.

For red spider I gave some two or three weeks ago the best remedy I knew of for the destruction of this pest. Persistent fighting of this miserable little pest is the only salvation from this trouble.

Greenfly or aphid must be kept down by the application of tobacco, and much attention will be required from this time on. Fumigating, i. e., burning of the stems or the smouldering of them by fire, is virtually impracticable, as it will destroy all the color, and many of the buds will be deformed from its application also. Tobacco stems strewn on the floors, such as the walks back and front and center, where such are used, or vaporizing with tobacco juice are effective remedies. The latter method of destroying them I have described at length in previous issues of your paper, but as there may be some new people in the business who have not seen the back numbers of the FLORIST I will describe it again. My method is to have a small steam boiler, say four or five horse power, placed so that pipes from it can be connected through all the houses possible. In my case I have run a  $1\frac{1}{4}$ -inch pipe through the center of the shed, branching from this with  $\frac{1}{2}$ -inch pipe into each house as far as it is necessary, then having two outlets in each house of half inch valves, or double threaded air cocks, on which we screw a coupling with a piece of steam hose attached about two feet long. In the end of the steam hose is tied securely a piece of quarter inch pipe about a foot long. When the house needs vaporizing we take a tub or large pail with a piece of wood across the top, with a hole in the center sufficiently large to put a quarter inch pipe through, put from one to two quarts of tobacco juice (according to the size of the house) in the bottom of the tub and a handful of tobacco stems over it and then insert the piece of pipe at the end of the steam hose, putting the pipe almost close to the bottom. With twenty pounds of steam in the boiler you can fill the house full of vapor so that from the outside it would appear in twelve to fifteen minutes almost as full as if filled with tobacco smoke. Two applications this way will, if carried out properly, destroy every fly in your house, and we have never found it to injure the most

A CORNER IN THE ROSE GARDEN AT THE WORLD'S FAIR.

tender foliage or most delicate flower. The reason we use two outlets in a one hundred foot house is because it can be done so much quicker. There is one thing necessary to bear in mind in this mode of applying it, and that is to have steam enough to do it very quickly. You might take twenty-five to thirty minutes to fill the house and do it three or four nights in succession, but the greenfly would still be in all his glory, as the slow process does not seem to affect him like the quick application. There are several manufacturers of tobacco juice from which it may be procured at the present time, or, if necessary, it can be made by the grower himself, but this is considerable trouble except in large places where they have the means of doing it. *Eternal vigilance* is the only means of keeping ahead of our enemies.

J. N. MAY.

WE HAVE received from Mr. Grove P. Rawson, Elmira, N. Y., bunches of blooms of roses of new crop including white La France (Augustine Guinoiseau), Meteor, Mme. Hoste and Mermet. All are exceedingly handsome flowers on long stems clothed with clean foliage, and they stood the long journey admirably, though

Mr. R. advises us that they were shipped on a very hot damp day. It is seldom that such all round good flowers are seen at this season of the year. Mr. Rawson certainly understands how to overcome the difficulties of the season in the production of fine roses.

#### September Color in Hardy Plants.

Mr. Stephen Taplin's remark in a recent number of the *FLORIST*, as to the absence of color in the September garden was undoubtedly pertinent.

As an encouragement to florists to place before the people a few of the enduring expressions of the season let me suggest masses of any of the following plants.

Of course I am aware of the almost universal demand upon the part of the customer for "something to bloom all the time." But these "all the time" plants should be the *setting* of a garden, and not its jewels. They should be foliage, for "all the time" flowers are impossible in all climates, and even if *attempted* are so few in number, as to make the garden of those who employ them nauseating in their monotony.

Interesting gardens are such as show us new forms and combinations.

Just at this time I find here and there all the plants I will name *dotted* in single specimens along a street two miles or more in length. They often occur in back yards out of sight; they produce no effect, for they are not used effectively.

It is for the florist to catch on to the possibilities of these plants, and bring out their beauties in a mass.

Let him plant a group of *Aralia Chinensis*, *Clethra tomentosa*, *Polygonum orientale*, *Polygonum sachalinense*, *Dinsmore rose*, *Echinacea purpurea*, and *Plumbago Larpendæ*, in well balanced numbers, and see how they will talk to his customers.

Again with a background of sweetbriar, or euonymus or both, let him plant *Callicarpa purpurea*, *Anemone Japonica*, *Aconitum autumnale*, *Aster novæ anglie*, *Begonia Evansiana*, *Conoclinium caelestinum* and *helianthemums*, and do it with the taste that is born in him, and I am sure surprise will manifest itself that we didn't do it before.

Another group may consist of the common poke in large masses, with *Boltonia latisquamæ*, *Helienium autumnale*, *Pyrethrum uliginosum*, phlox in variety, *rudbeckias*, and *Salvia azurea* or *Statice latifolia*. But I would suggest the late

varieties of *Kniphofia*, in large clumps, with the green *Eulalia gracillima* and then a border of *Sedum spectabile* and *Plumbago Larpentae*.

There are lots of other combinations, which I must postpone just now.

JAMES MACPHERSON.

#### Seasonable Hints.

Our task is now ended. We have rounded out the carnation year, and find ourselves again at the point of beginning. We have endeavored to give a plain statement of our mode of growing this flower, fully conscious of the fact that many growers will not entirely agree with us. But it must be remembered that many circumstances enter into the case, whereby a man must be the judge of his own course of action. Location, lay and shape of the houses, kind of fuel used, manner of heating, nature of the soil, varieties grown, distance from market, personal disposition, etc., etc., are all elements that enter into the problem. He is the most successful grower who studies these various requirements and adapts himself to his surroundings. But the novice must bear in mind there is no large fortune awaiting those who embark in this business. There are risks to run not known in other trades. The margin of profit is close, and depends on many small things to make all ends meet. This is more true to-day than it was ten or twenty years ago. On the other hand there is plenty of hard work, physically and mentally, and considerable capital required. Still there is room for all who really have a love for this delightful occupation.

The carnation is filling a larger space year by year in the world of flowers. It will continue to do so as long as its devotees foster its cultivation and improvement. We are not quite sure, however, that the exhibitions contribute to its popularity. Unfortunately it is misrepresented at the fairs, where it is like the grass of the field "which to-day is and to-morrow is cast into the oven." As an exhibition flower the carnation is not a success, unless some means can be devised to keep them fresh and crisp. If this is impossible then by all means renew the blooms every day if necessary. The multitude will not take kindly to a flower that fades so quickly, however beautiful when first staged. If this false impression could be removed the carnation would at once outrank the rose in popularity. But the initiated need not be told there is no flower more lasting and that will bear more ill usage with impunity by the fireside, at the ball or entertainment, or worn as a corsage on the street. While we accord all due honor to the queenly beauty of the rose, the carnation is the gift of the gods, and destined to be the flower for the million.

Avondale, Pa. W. R. SHIELMIRE.

#### An Unfortunate Blunder.

ED. AM. FLORIST:—On page 124 of the AMERICAN FLORIST, September 14 issue, I notice a communication under the head "An Unfortunate Blunder," signed C. B. The "well known florist" referred to I

presume to mean myself. The facts are as follows:

On January 17 I shipped to C. Bliss & Son, Ashtabula, Ohio, a bill of young carnations, including 400 Silver Spray. About the last of August I received the enclosed postal card. [A rather tart one.—Ed.] Feeling a little annoyed at receiving such a communication on a postal card I at once replied to the effect that I could not see at this late day why I should be in any way responsible for disappointment in the carnations sent last January, and I could not understand how I could have sent him Mrs. Fisher, as I never had a plant of that variety on my place until late last spring, when I bought a few young plants. I also at same time enquired regarding the stock which formed the other part of the bill.

Since reading the note in the FLORIST above referred to I have examined my books for possibilities, and I find that I bought large numbers of Silver Spray from other growers to help me out with my orders during last winter and early spring, and the only way in which I can account for the "Unfortunate Blunder" is that I have received Mrs. Fisher for Silver Spray and reshipped them for what I had bought.

Now, therefore, as no complaint was made until the stock began to flower it is reasonable to suppose that as far as health, etc. was concerned everything was satisfactory, which leaves a question of the difference in value between 400 flowering plants of Mrs. Fisher and the same number of flowering plants of Silver Spray, and if two or three fair minded florists will state through the AMERICAN FLORIST what the difference is in favor of Silver Spray I will send my check to Messrs. Bliss (provided they are the proper parties) to cover the amount.

Paterson, N. J.

H. E. CHITTY.

[We hoped to hear from other parties, not directly interested in the transaction, before expressing an opinion on the subject, which seems to us to be of considerable importance, not in this particular case, but as establishing a precedent by which the results of future similar errors might be adjusted. It is possible that the difference in value of the two varieties noted may be very slight in this case, but presuming the difference to be such as to make the plants practically worthless to the purchaser, how should the difference be adjusted? The seller certainly takes upon himself the responsibility of guaranteeing his stock to be true to name, and a part of his stock in trade is his reputation not only for probity but for accuracy as well. That the error was entirely unintentional does not change the fact that the buyer ordered one thing and got something else that he did not order. And be the unintentional substitute ever so good it does not change the rights of the purchaser or the responsibility of the seller. Further, the average buyer can not be expected to be able to detect the difference before the plants bloom. Therefore, while in such cases the buyer should endeavor to make the best possible use of the plants sent him and thereby reduce the expense of the error to the seller (when convinced that the same was unintentional) he certainly possesses the right to demand that field grown plants of the variety ordered be shipped him freight prepaid, he to return to the seller the plants grown from the young stock of the other variety sent him, the seller to pay the freight on these also. This places him in the position he would have been had the error not been made, and as the error was on the part of the

seller he should bear all the expense of accomplishing this result. This in our opinion is the way such errors should be remedied, but we are willing to listen to the views of others.—Ed.]

#### Seasonable Hints.

The plants that have been grown in pots outside if not already in their winter quarters should be housed at once, for at this date frost may be expected any time. These, and those which have been grown on benches where the glass has been removed, are possibly infested with the Tarnished Plant Bug (*Lygus pratensis*).

TARNISHED PLANT BUG.  
[Five times natural size.]

This destructive bug procures its food by thrusting its beak or sucker into the tender growth, extracting the sap, thus causing the tips to flag, which may be considered evidence of their presence. The young bugs, which are of a yellowish green color seem to confine their depredations to the apex of the stem, and soon destroy the center, which they repeat upon the laterals as they appear until the plant often becomes a mass of blind growth.

The adults are yellowish brown, about 3-16 of an inch long, and will continue their destructive work upon any part of the plant or flower that is soft and abundant in sap. They puncture with such violence as to distort the growth and ruin promising buds, and later on deface the petals of expanding flowers. The pest is known in nearly all parts of the United States, being more or less destructive to many other plants such as asters, golden rod and sunflowers, and are very partial to carnation blooms. Hand picking is the best remedy I have found, although I have just been informed that pyrethrum insect powder and kerosene emulsion have given satisfactory results; but not having had an opportunity to try either I can not vouch for their efficiency.

This insect is by no means new, and it is to be hoped an effectual remedy may be discovered, for owing to its ravages the growing of chrysanthemums out of doors is very unsatisfactory in many localities.

The early varieties are now well set with buds, and all plants that have not been staked and tied should be attended to at once, so the disbudding can be done before the buds are too large, and by the way, many of the varieties are now ready.

BRANCH OF CHRYSANTHEMUM SHOWING MASS OF BLIND GROWTH INDUCED BY DEPREDACTIONS OF THE TARNISHED PLANT BUG.

Do not hesitate about disbudding, for fine blooms can not be had when they are left to nature. Remember one good flower is worth a dozen poor ones, and even though your trade does not seem to require the finest quality you can in a few years create a demand for such by growing a few exhibition blooms as tempters.

Liquid foods should be administered two or three times a week, but always water dry plants before applying. Avoid giving it too strong to make up for any neglect the plants have had in this direction, but on the other hand if weaker than ordinary giving it more frequently, daily if necessary; this will give better results and be safer.

Where chemicals are used as food use  $\frac{1}{2}$  ounce of sulphate of ammonia to three gallons of water. Nitrate of potash should be used in the same proportions, while  $\frac{3}{4}$  ounce of nitrate of soda will be safe for this quantity of water.

Keep the aphid well subdued and give abundance of air at all times when the weather is favorable.

ELMER D. SMITH.

Adrian, Mich., Sept. 20.

#### Chrysanthemum Notes.

For the last few years the best chrysanthemum flowers sent to the Chicago market have come from W. N. Rudd, Mt. Greenwood, Ill. We called upon Mr. Rudd last Thursday and we give below the result of our inquiries as to his methods of culture and varieties most useful for his purposes, namely the production of fine blooms at a profit to the grower.

In yellows he uses Mrs. J. G. Whilldin for early, H. E. Widener for midseason and W. H. Lincoln for late. He also grows a few Col. W. B. Smith and likes it very well. But the great bulk of his stock of yellow sorts are of the three first mentioned.

Among sorts that he has grown and since discarded in favor of the sorts mentioned above are Gloriosum, as he finds Mrs. Whilldin better, and only a little later; Golden Empress, which is pretty but not a clear enough yellow; Rohallion, which lacked in vigor; Gorgeous, good but not needed; Kioto, too long legged and weak in the neck; Mrs. Frank Clinton, not double enough; Ramona, wasn't quite as good as Lincoln and came at same time.

He still grows some of Mrs. Maria Simpson and Mrs. L. C. Madeira. The latter is a pretty thing but he don't care for very late sorts because he needs to get his chrysanthemums out of the way as soon as he can to make room for other stuff.

He was favorably impressed last year with Emma Hitzeroth, Dr. Callandreau and Golden Wedding and is giving them a further trial this year. He has nearly all the new sorts of promise on trial for the first season, but of course cannot speak of them till next year.

In pink sorts Viviani-Morel is his best early. Excellent and Harry Balsley for midseason. He can't say enough in praise of Harry Balsley. It is a grand thing with him and very profitable. Mermaid and Olga are his late pink varieties. He likes Mermaid because it is dwarf and

can be grown on the side benches nicely.

The pink sorts he has discarded in favor of the above include E. V. Hallock, not equal to Balsley; T. C. Price, a fine thing but often doesn't open well and is long legged; Elkshorn, a pretty flower when well done but a poor keeper and shipper; Ada Spaulding, too small with him and there are enough equally good and better; Miss Mary Wheeler, a beautiful thing and discarded principally because he had too many pink sorts; Miss Mary Morgan, too small; Violet Rose, a muddy color; Lilian B. Bird, not reliable and apt to come malformed and even when it comes good it seems impossible to get it to market without sustaining injury; Edward Hatch, color not decided enough; Exquisite, preferred Excellent which had all its good qualities and seemed better in some respects; Frank Thompson, a back number; Roslyn, fine thing but color too deep; Louis Boehmer, color not bright enough though still the best of the hairy type; Waban, a fine show flower but not profitable as a cut flower.

Pink sorts on trial second season and favorably impressed with are Aristine Anderson (early) and W. N. Rudd. He has nearly all the new pinks but speaks of none that he has not given at least one year's trial.

In whites for early Ivory stands at the top, and more than head and shoulders over any other. He considers it the nearest to the ideal of any chrysanthemum of any color. And it is equally valuable for pot plants as for cut flowers. No other white can touch it for any purpose in his experience. For midseason Domination and Minnie Wanamaker are his favorites. For a trifle later he uses Mrs. J. Jones and for latest Christmas Eve.

Among white sorts that he has discarded in favor of the above are Elaine, earlier than Ivory but not nearly so good; L. Canning, an excellent sort but not so good as Domination and Wanamaker; Diana, a back number; Mrs. Alpheus Hardy, don't know how to grow it; Mons. Scypere, a beautiful flower but don't sell; Flora McDonald, not a good white; Mountain of Snow, not so good as Christmas Eve; Adirondac, a back number; Jessica, they do it fine east but it is no good here; Mrs. Louise Leroy, a beautiful thing but comes in too nearly with Ivory to find sale; Mollie Bawn, a fine flower but no good for cut flowers as it won't ship; Annie Manda, don't like it; Flora Hill, can't make it grow; Ada McVicker, flabby; Mrs. Geo. Bullock, too much like Domination; Mrs. Gov. Fifer, flower a little too loose. He has Jos. H. White on trial and is favorably impressed with it. A host of new whites are also on trial.

In miscellaneous colors he grows some of Harry May, a fine thing and useful; E. G. Hill, a good sort, Geo. W. Childs he finds too unreliable; Cullingfordii is still the red, he knows of no other chrysanthemum that has the color and is any good for cut flower growing; O. P. Bassett is a good late red; Lilian Russell he likes very well; Mrs. Benj. Harrison is a pretty thing and useful but there are many better ones of similar type.

He finds that flowers with short straight petals are the kinds that take in the Chicago market. Ivory is the type of those that sell best.

Following is his system of culture, but it must not be overlooked that he grows entirely for cut flowers. In fall he propagates from the old plants in the usual way and the young plants are carried over in the houses till the following spring. These are planted out in the open

ground as early as possible, usually about the middle of May. Cuttings are taken from these from the middle of June to the middle of July. He has rooted cuttings as late as the last of July and had good results. He finds that he gets better wood from plants that have been bedded outside as above described. It is necessary to have twice as much stock of W. H. Lincoln as of other sorts, as that variety does not make as many cuttings as the others. He is careful to get the cuttings into the sand without flagging. When rooted the plants are potted into 2½-inch pots and are kept moving for all they are worth from this time till flowers are cut.

Early in August most of them will be in 3-inch pots, and they are then planted out on the benches about eight inches apart in six inches of soil including the sod strips at the bottom. The soil is two-thirds rotten sod and one-third cow manure. He prefers to mix the soil the year before and let it stand over winter before using.

Staking is done as soon as the plants are eight to ten inches high. The stakes are of No. 6 galvanized fence wire straightened and cut to lengths of about four feet, or shorter where glass is too low to admit this length. With Ivory, Lincoln and Mermaid no stakes are used. Two wires are stretched along side of a row of plants, one wire above the other, and to these the plants are tied as growth is made.

At first he waters lightly and carefully but syringes a good deal, but after the bench is full of roots he gives them large quantities. When the buds begin to show color he is careful to keep a dry atmosphere at night.

He feeds liberally when the plants are strong enough to assimilate it, but watches each variety and feeds according to its needs. When the plants are overfed the foliage is unusually dark, the leaves thickened and cupped and very brittle, cracking quickly when bent. He thinks the brown tips frequently seen on leaves is produced largely if not entirely by over-feeding.

He finds that fresh cow manure, nightsoil, etc., produce a rank growth and make a coarse plant. Sulphate of ammonia seems to especially encourage growth of stalk and foliage but not so rank as the cow manure, etc. Nitrate of soda seems to favor growth and coloring of flowers at the expense of stem and foliage.

Therefore when a variety seems to lack vigor he gives it cow manure, nightsoil, etc. If the condition of the plant indicates that it does not need above then he uses the sulphate of ammonia. After the buds are well formed he feeds largely with nitrate of soda, with an occasional dose of cow manure, nightsoil, dissolved bone, bone black, etc.

He generally begins feeding as soon as the soil is well filled with roots, beginning with very weak doses and gradually increasing the strength as seems discreet. At first he feeds about once in ten days and toward the last gives it to them as often as twice a week, watching each plant and skipping those that seem to have had all they can stand. The whole secret of feeding lies in good judgment and experience.

All his plants are grown to produce one fine flower, and he almost always takes the terminal bud, rubbing out all the other buds of all kinds, as this seems to give better foliage on the stem, which is a great desideratum in a fine flower to-day. With Lincoln and varieties of similar growth it is especially important that disbudding be done as soon as possible

after buds form as if the operation is deferred the stem is apt to come crooked, and a straight stem is essential in a cut flower. The plants are kept carefully tied to the stakes as growth is made to keep the stems straight.

He has been troubled this year by grasshoppers and leaf-rollers, but has discovered no remedy except hand catching and hand picking. There is also a worm that eats out the crown, for which hand-picking is the only remedy he knows.

The flowers are never cut till fully developed and are much better if then placed in jars of water in a dry cool cellar for two or three days before being sent to market, cutting off a piece of the stem of each flower and changing the water daily. Some varieties can be kept this way for two weeks and show improvement all the time, if care is taken to overhaul them every day. Most of the whites will improve in clearness of color if subjected to this treatment. But the cellar must be quite dry. A damp one would do more harm than good.

Chrysanthemum flowers, especially colored ones, must be kept away from ice or the color and quality of the flowers will suffer.

Referring to his system of propagating late and growing all plants to single stem and single flower Mr. Rudd says he gets much better returns per square foot of bench surface than he would by growing larger plants and more flowers to a plant.

#### The World's Fair.

An interesting feature of the department greenhouses at the present time is the collection of new and beautiful caladiums received from the Brazilian government. The tubers were received early in August and were immediately potted in 6-inch pots. They have been kept in one house from the time they were started, but it is likely that they will soon be removed to the dome. The house is tolerably light, having only a light shading on the roof. About four weeks ago the plants were shifted into 8-inch pots; they have all grown well and are in fine condition.

The first thing to strike an observer is the remarkable brilliancy of the colors in some cases, the waxen delicacy in others.

In some cases the leaves have such a translucence that they suggest paraffine paper or thin sheets of wax. In several varieties this transparency is so strongly marked that distinct writing, laid underneath, may be read through the leaf.

Among brilliant colors the variety Pitanguy is worthy of note; it has a large, bright red leaf, with deeper veins and pale green border. Cannaviera is a very dwarf small-leaved sort, red, with deeper veins and light bright green border. Wilhelm Ziegler is very distinct and handsome, stalk and ribs deep purple, leaf dark green, mottled with white and suffused with red—a very desirable variety. Mucuripe, a very showy sort, has old rose center, shading to white, with delicate green border. Coxim has purple stalks, large leaves with red veins and white center suffused with red; the green border is marked with red blotches.

Benevente is an example of the waxen transparency noted. The color is a delicate flesh, with a border of bluish green, the veins deep flesh color. The leaf is so extremely waxy that some of the visitors refuse to view it as a product of nature and insist that it must be artificial. Coimbra is green, veined with flesh, splashed with white. Ladario, a handsome green with flesh colored veins. Joao de Barrios is very striking; a small pointed leaf of bright green, splashed with white, stalk black. Roderio is another of the waxen ones, leaf entirely white, faintly bordered pale green. This seems to grow strongly, yet one cannot help thinking that such an absence of all coloring matter must point to a delicate constitution; it appears unnatural.

Ayres da Cunha has a red stalk, supporting a small cordate leaf, surface deep green, with red veins. Two varieties of unusual beauty are Rio de Janeiro and Guaiuby; the first has the leaf entirely of bright rose, with deeper veins, the texture very waxy; the second leaf stalks of deep purple, leaf rose, with red veins. Pedro Alvares Cabral has brilliant light green leaf, with red veins; Jaguaruna, leaf with white center, suffused with rose; and Concordia, a red stalk, supporting a red leaf with crimson veins and greenish border.

Azulao is remarkable for its bluish tint; the center and veins are a sort of mulberry purple, with a faint grape-like bloom on the surface; the border is green. Guil Mar is old rose, with whitish veins and blotches, waxy; Taperoa, red veins, leaf green and red; Pelotao, rose with red veins, the leaf oddly blotched with lighter rose, border green. Paracupeba is a large red leaf, with green border; Itapocu, a brilliant red, with deeper veins and a green line on the margin. This is a very vigorous grower. Trahirasis pure white, with deep green veins; this is a very marked variety, apparently robust and fine in contrast with the red sorts. Carapina is another very robust grower; the leaves are large, rose colored, with deep, green veins. Iracema is an attractive dwarf plant with small leaves, pale green, blotched with red, veins white. Joazeiro has deep red stalks, leaf deep bronzy red, with red veins; Araruama, pale red, with pale green border, a small pointed leaf and dwarf growth. Itaboca has a large, greenish white leaf, very translucent; Rio Bonito is of similar type, white, with a green line on the edge. Wilhelm Pützer has a velvety red center, with pale green edge. Assungu, particularly fine, rose color, with deep green veins, very large and robust; Rio Vermelho, white, suffused with rose, deep rose veins.

EXHIBITS OF HARDY PLANTS AND SHRUBS ON THE ISLAND AT THE WORLD'S FAIR.

Quite a number of the tubers of these caladiums were small and the plants are all smaller than those in the G. W. Childs collection, which have been on exhibition for some time. But the coloring throughout is of remarkable beauty, in many cases utterly unlike anything we have seen before, and the exhibit is most interesting. These plants will be a great attraction when moved over to the dome.

The New York display of tuberous begonias is now in fine order, covered with bloom and in perfect health. The aristolochia is again flowering freely. In the large building things are much the same as at last writing; among orchids now in bloom in Pitcher & Manda's display are *Vanda cœrulea*, *Oncidium varicosum* Rogersii, *Cypripedium Ashburtoniae*, *C. Sedeni*, *C. Sedeni candidulum* and *Stanhopea grandiflora*.

#### Awards at the World's Fair.

The list of awards to exhibitors in the Bureau of Floriculture has been issued. The names of those who receive medals appear below:

NEW YORK.—F. R. Pierson Co., Tarrytown, seven varieties of cannas; New York Florists' Club, horticultural literature; E. Asmus, lilies of the valley; Ed. Jansen, New York, wicker vases; New York State Commission, tuberous begonias, palms, hollyhocks, irises, roses, crotons; Peter Henderson & Co., New York, primroses, rubra, cyclamens, pansies, etc.; Canna Mme. Crozy; J. M. Thorburn & Co., New York, Cyclamen atropurpureum; Siebrecht & Wadley, New Rochelle, *Onvirandra fenestralis*; Fred W. Kelsey, New York City, rhododendrons; William Tricker, Dougan Hills, *Nymphaea Laydekeri rosea*; New York State Museum, Albany, fungi; D. B. Long, Buffalo, floral photos; Abenroth Brothers, New York, plant receptacles, vases; J. H. Small & Sons, New York, floral designs; Reed & Keller, New York City, florists' supplies; Mrs. H. Walter Webb, New York City, mounted fern collection; Ellwanger & Barry, Rochester, hollyhocks, pæonies, rhododendrons; William Nilsson, New York City, bedding plants and ornamental design; Elleen Doulan, Brooklyn, bedding plants in ancient harp design; G. Marc & Co., Flushing, roses; Parsons & Sons Co., Flushing, rhododendrons.

PENNSYLVANIA.—Henry A. Dreer, Philadelphia, cineraria, primrose, gloxinia, caladiums, ferns, cannas; Pennsylvania state board, ornamental foliage plants, canna; Geo. W. Childs, Philadelphia, caladiums; A. Blanc & Co., Philadelphia, cacti; E. Stebe & Sons, Philadelphia, plant receptacles and cork decorations; E. Kaufmann & Co.,

Philadelphia, floral designs; B. A. Elliott, & Co., Pittsburg, herbaceous plants; Dingee & Conard Co., West Grove, roses; George Craig, Philadelphia, roses; William Hamilton, Allegheny Park, specimen palm; H. S. Rupp & Sons, Shiremans-town, double white primrose.

ILLINOIS.—J. C. Vaughan, Chicago, ten varieties of canna, deep crimson cyclamen, collection of roses and Senator McNaughton rose; Miss Nettie Palmer, Edison Park, herbarium; Mrs. C. A. Sheldon, Chicago, herbarium of Mexican winter flora and algae; E. A. Bechtel & Sons, Staunton, double flowering crabapple.

NEW JERSEY.—Pitcher & Manda, Short Hills, ferns, floral photos, lilies, pyrethrums, iris, herbaceous plants, roses, orchids, palms, tree ferns, araucarias, rhododendrons, ornamental foliage plants; E. D. Sturtevant, Bordentown, aristolochia, nymphæas.

MASSACHUSETTS.—R. & J. Farquhar, Boston, double crimson primrose, cyclameu, cineraria; Rea Bros., Norwood, herbaceous plants.

MISCELLANEOUS AMERICAN.—E. G. Hill & Co., Richmond, Ind., begonias; Montana State exhibit, herbarium; Mrs. L. E. Howey, Montana, herbarium; I. N. Kramer, Cedar Rapids, Iowa, canna; Dayton Star Nursery Co., Dayton, O., roses; Anna B. Nickels, Laredo, Tex., cacti; Sherwood Hall Nursery Co., San Francisco, sweet peas; California Nursery Association, Niles, Cal., roses; state of Kentucky, herbarium; Nanz & Neuner, Louisville, roses; Miss Sadie Price, Bowling Green, Ky., herbarium sketchwork; Women's Board of Colorado, Denver, herbarium; Mrs. S. B. Walker, Castle Rock, Colo., herbarium; Missouri State Commission, herbarium.

#### FOREIGN.

GERMANY.—Henry Mette, Ernst Benary, Haage & Schmidt, Otto Olberg, T. J. Seidel, Kohlhaas & Hohnsanger, Otto Schlee, C. Beuttenmueller & Co., H. Wrede, Frederick Maecker, Carl Gorms, Dresden florists, Oskar Tiefenthal, Lambert & Reiter, Pape & Bergmann, V. Doppleb, C. Platz & Son, C. Schwaencke, Martin Grashoff, Wilhelm Pfäzter, E. Neubert, E. Vandersnussen, Gust Schultz, Julius Hansen, Frederick Roemer, Joseph Mock.

HOLLAND.—Boskoop Nursery Association, Jac. Jurissen.

AUSTRIA.—E. Seyderheim.

ENGLAND.—John Laing & Sons, James Carter & Co., Kelway & Son, H. Cannell & Sons, Anthony Waterer & Sons.

IRELAND.—Alexander Dickson & Sons.

NEW SOUTH WALES.—Commission of New South Wales.

CAPE COLONY GOVERNMENT.—Mrs. Ogilvie, Cape Government.

FRANCE.—Vilmorin, Andrieux & Co., Croux & Sons, V. Lemoine & Sons, M. Moser.

GUATEMALA.—Government of Guatemala.

BRAZIL.—Ourto-Preto pharmacy school.

CANADA.—Mrs. A. M. Croly, Ontario government commission.

#### Killing Grubs in Soil.

Mr. W. N. Rudd, Mt. Greenwood, Ill., treats all his soil with live steam before using, and thus gets rid not only of grubs but all other insect larvæ and germs of fungus, etc. that the soil may happen to contain, and weed seeds too. He never has any weeds in his houses until after he has used a mulch or has otherwise fed the plants after being benched.

His method of treating the soil is very simple. In the frame yard he has a big box or bin 20 feet long, 6 feet wide and 4½ feet deep, well braced. In the bottom is a run of three 1¼-inch steam pipes in the sides of which 3-16-inch holes are drilled every 18 inches. The soil is thrown into this bin and when full it is covered with hotbed sash and the steam turned on. About two hours of this is sufficient to kill all animal or vegetable life in the soil. It is the general habit to put a few potatoes on top and when these are cooked the soil is in condition. One would imagine that this cooking would make the soil soggy, but it has no such effect, and indeed the soil seems in better condition afterward than before the steam has been applied. And the fine condition of plants growing in soil that has been so treated proves that the soil has not been injured in the least.

After the bin has been built, and the expense of same is slight, the only cost of treating the soil is the two handlings, one in and one out of the bin, and in view of the frequency with which serious loss is caused by grubs and fungi, etc., in the soil, the precaution is one that no grower should fail to take.

We request subscribers to make remittance by draft or money order when renewing subscriptions, and to keep a record of the numbers and dates of same. This is to guard against losses in the mails.

## Philadelphia.

Isaac Kennedy has returned from his trip to Cape Cod, where his family have been spending the summer. He describes it as an ideal health resort.

All the seed stores and those of the florists who handle bulbs now have their windows full of this class of stock. The bulbs seem to be in fine condition, and from all accounts business in this line will exceed previous seasons.

The September meeting of the Penna. Horticultural Society was fairly well attended. Vice-President Reed occupied the chair. The coming chrysanthemum show was discussed, and it was the general opinion that it would equal, if not excel, all previous exhibitions. Some entries have already been received, and from the interest taken by intending exhibitors it is thought that the cut flower department will be a very attractive part of the display. The exhibits of cut roses will, it is said, be larger than ever before. It is thought, too, that the novelty of holding the show in the beautiful Armory building will also attract visitors.

Secretary Farson reported that the temporary roof over the front portion of the hall had been completed, and that with a little paint and plaster the library and office would soon be ready for occupancy. It was also agreed to have all the hooks brought back and arranged on the shelves, as it is not at all likely that any change will be made for some months.

This valuable property is considered to be worth from two hundred and fifty to three hundred thousand dollars, and if we are informed correctly it is now for sale. It was said by those favorable to the sale and investment of the proceeds, so as to secure a permanent income to the society, that the property would easily bring a sum considerably over \$250,000. It has been in the market now for over two months and we have yet to hear of an offer at any price. Horticultural Hall has been a landmark in Philadelphia for a long time. Since it came into the possession of the society it paid expenses, but there was nothing left to go into the treasury. It is managed by a board of trustees, and when they came into control they found the building very much out of repair, and considerable money had to be and was expended the first and second years to put the property into such condition that it could be rented. Since that time a great deal of money has been annually paid for other repairs and improvements. Only a few months before the fire the insurance companies ordered iron shutters to be placed on the windows along one side of the hall; this was quite an expense and did not add anything to the earning capacity of the building. Although the hall answered the purposes of the society it was not at all a modern building, nor one in keeping with similar structures of to-day. Yet it managed to pay running expenses as well as all repairs and improvements. In addition it is estimated that the valuation has increased at least \$25,000 since it has belonged to the society. Those who desire the property sold say that the limit has been reached; that if the society held it for ten years longer they may not get as good a price as they can at the present time. We are glad to say, however, that this is not the unanimous opinion; those who think that Philadelphia is done will wake up some day and wonder where they are. It is conceded that the present location is the best in the city for a fine hall that can be rented for high class entertainments, such as concerts, balls, public meetings, fairs, etc.,

etc., and the society could erect just such a building by adding to the present insurance money a suitable sum that could easily be borrowed on the ground. The interest on this would make a mere nominal rent, and with a sinking fund the mortgage could in time be paid. If the trustees have obtained the power to sell they could as easily get the authority to make a loan, and we feel sure the new hall would make more money than the portion it is proposed to invest would return, and the society would have a magnificent home, and one that would add prestige to its already honorable name.

Business has been nothing to brag about the past week; there has been plenty of stock of good quality, and we feel sure we voice the trade when we say that we are all sorry, very sorry, that the demand hasn't taken on that promised brace. Prices remain about the same as last week.

Chas. Kohlert, of somewhere in the vicinity of 1514 Chestnut street, stands a trifle taller, and his smile is some inches broader these days, it's a "b'hooy."

The McLean team of bowlers have defeated the Craig boys twice in succession the past two weeks on the club alleys. In the last match Anderson put up 511 in the three games. K.

## New York.

Roses in all varieties have shortened up considerably. The number of American Beauties and Meteors coming in is not more than one fourth of what it was one week ago and there is now no difficulty to dispose of them all at a price. Prices have not advanced any as yet, but the stock is fairly well cleaned up every day. There seem to be more Perles grown this season than there were a year ago, and those that are coming in are of very fine quality. Cusin, as usual in the fall, is of very deep color, some blooms being as dark as Gontier, but buyers do not fancy it in this condition.

Trade over at the 34th street market is quite dull. A severe frost to put an end to the surplus outdoor flowers is what they are praying for. Johnnie Weir is around his old familiar haunts again, the only evidence of his recent trip to Chicago being an occasional mysterious remark about Montana, and a disinclination to walk to and from 34th street in the mornings. This latter feeling he shares with John Raynor and Alex Burns. An express wagon is the height of their aspirations so far, but a two horse carriage is probably only a question of time.

W. K. Harris, of Philadelphia, was a recent visitor to Ernst Asmus' place, where the chrysanthemums have now reached their interesting period. On comparing notes it appeared that chrysanthemums at West Hoboken are considerably earlier this season than they are at Philadelphia. On some varieties the buds are already one half inch and upwards in diameter. Ferdinand Bergeman is the earliest white. Mr. Asmus observes that the succession of varieties as to earliness varies greatly from year to year, the earliest bloomers of last year being this season far behind some that were beaten by them last year. He has a seedling of last year which he describes as a "yellow Ivory" which promises to be very early this season. Mr. Harris naively remarks: "We have heard of yellow Ivories before," and adds with a look of pride, "Ivory is the world's standard."

Flora Hill and Golden Wedding are both poor growers with Mr. Asmus, and neither will stand pinching. The Cali-

fornia novelties are also proving unsatisfactory. His carnation plants have suffered from the dry weather somewhat in size, but all look well, none showing any sign of rust excepting Emily Pearson. On being asked whether he should force many tulips this winter Mr. Asmus replied "not a tulip."

If newspaper notices count for anything Mr. Fleischman's new store on Broadway ought to make a big success, for all the daily papers have been well filled with descriptions of this new attraction and its enterprising owner. But is it wise to say too much about immense profits? If one does not want to be overwhelmed with competitors the less said about immense profits the better.

The Wabash R. R. people have been much disturbed regarding that much-talked-of supper which the New York delegation to St. Louis lost on their westward trip, and have been raking their agents on that part of the road over the coals. It transpires that the trouble resulted from the temporary absence of a telegraph operator from his post, he having gone to deliver in person a death message which he had received for a neighbor. It is not likely that the mishap will occur again in that vicinity. However, barring that one incident, no delegation of florists was ever treated with any greater courtesy than this party received from the officials of all the roads over which they traveled.

## Chicago.

Flowers are extremely scarce; the early part of this week there was not enough material to fill the demand. The shortage applied to all classes of flowers. Two sharp frosts have cut down the little remaining outdoor bloom, which has been poor in quality for some time, and many growers are wisely limiting the production inside for the sake of strengthening their plants. So prices are stiffening, and there is already a little advance.

Roses are scarce; Meteors, which have been coming in fairly all summer, are now falling off and there is some advance in the price of La France, Mermet and Perle. Carnations are very scarce, somewhat inferior in quality. Violets are too few to be quoted, and only single ones at present, though Marie Louise is expected almost daily. Valley is very limited. A few straggling gladioli are seen, but they are really at an end. Prospects of trade are brightening, and, within a month, both stock and prices will be much better.

Recent visitors: A. W. Bennett, Pittsburg; Richard Merritt (with J. M. Hodgson), New York; J. Lymas (gardener to Capt. Vandergrift), Pittsburg; John N. Laurie (with Lord & Burnham Co.), Irvington-on-Hudson, N. Y.; W. J. Hesser, Plattsmouth, Nebr.; Alex. Kennedy, New Brunswick, N. J.; C. W. Kennedy, Oil City, Pa.; E. C. Beatty, Oil City, Pa.

## Boston.

Saturday, September 23, was the last of the series of free weekly exhibitions at Horticultural Hall. Hardy asters were the special attraction and were shown in great variety. A large number of visitors was present admiring the beautiful display. Asters have never been seen here to better advantage. Each year seems to show an improvement in colors and size of flower. Geo. Hollis was again the largest exhibitor, his collection containing no less than thirty-nine species and including a number of beautiful hybrids. Shady Hill Nurseries, Mrs. P. D. Richards,

BASIN OF AQUATICS IN FRONT OF THE HORTICULTURAL BUILDING AT THE WORLD'S FAIR.

THE OLD FASHIONED GARDEN IN THE NEW YORK STATE DISPLAY AT THE WORLD'S FAIR.

Rea Bros. and others also showed fine collections.

Dahlias are still in full glory, and W. C. Winter and John Parker made their usual display of the showy blooms. J. R. Leeson showed a plant of *Saccolabium guttatum* in bloom, for which a bronze medal was awarded. A branch of Louise Bonne pear bearing fruit and flowers at the same time was exhibited as a curiosity from a south Boston garden.

N. F. McCarthy & Co. had their first auction sale of plants on September 23. Palms and carnations in variety formed the bulk of the stock offered, and the prices realized were on the average fully up to regular prices at the nursery.

There are a good many roses coming in daily and the quality is improving, but carnations it is almost impossible to find. When a few do appear they go off at sight for two dollars per hundred. Asters are not very plenty and are in good demand. Gladioluses sell poorly this season and although they are unprecedentedly good, yet a large part of them find their way to the rubbish barrel.

Mr. J. G. Jack has begun a series of lectures and field meetings at the Arnold Arboretum for the purpose of giving popular instruction about the trees and shrubs that grow in New England. The meetings are held on Wednesdays and Saturdays until November 4.

#### Massachusetts Horticultural Society.

The annual meeting of this society for the choice of officers and standing committees will be held in the library room, No. 101 Tremont street, Boston, on Saturday, October 7, 1893, at 11 o'clock, a. m. Agreeably to the constitution and by-laws the polls will remain open at least two hours.

The officers and committees to be elected are: A president, four vice-presidents, a professor of botany and vegetable physiology, a professor of entomology, a delegate to the state board of agriculture, a delegate to the board of control of the State Agricultural Experiment station, an executive committee of seven members, a finance committee of three members, a committee on publication and discussion of three members, a committee for establishing prizes of two members, a committee on the library of five members, a committee on gardens of three members, a committee on fruits of seven members, a committee on flowers of five members, a committee on plants of five members, a committee on vegetables of seven members, a committee of arrangement of two members.

The committee for establishing prizes, *elect*, will consider the schedule of prizes for the year 1894 on the first Saturday in November. Members of the society having any suggestions to make for the improvement of the schedule will confer a favor by communicating such suggestions to the chairman of the committee before that time.

Baltimore.

"It is the unexpected that happens," said a shrewd observer of human affairs; and it was the unexpected that came out of a little parcel that arrived by mail the other day, nothing less, in fact, than a spool of dark green shoemakers' thread. Now, after having made sure that there was nothing of the kind to be had here, it was rather vexatious to find that it was to be had in a much smaller town, but there it was, and after all it is a good thing wherever it comes from, and ought

to be welcomed by the smilax men everywhere. The spool is marked 4 ounces Saint Andrews Thread, No. 10, cost thirty-one cents and came from Buffalo, N. Y. It is close twisted and very strong, and dark enough in color to fade out to a true smilax shade after being strung up a few weeks.

Business here continues "flat, stale and unprofitable" enough, but the summer is almost over and there was never a better prospect for a good winter supply in the history of Baltimore. We are going to supply ourselves with cut flowers, mark that. After that result is reached some of the more adventurous spirits may undertake to supply someone else, but the supply for ourselves is in sight anyhow.

A successful grower of violets, in a small way, in the neighborhood of Govans-town, gives as his method late propagating and keeping in active growth until winter. His plants are perfectly clean and free from spot, but the flowers would hardly be early enough for profit.

MACK.

St. Louis.

The protracted dry spell has at last been broken by several days' rain and it is hoped that the extremely warm weather prevailing during the first part of this month will be affected in the same way; certain it is that nothing can be looked for in the way of trade until cooler weather prevails.

A meeting of the members of the exhibition committee was held during the week and the plans for the fall show completed; the work to be done, such as advertising, printing and many other details, were all placed with members, who will carry them forward to completion. It has been decided that two of the special prizes offered at the last club meeting shall be for cut flowers; one calls for the largest and best collection of cut carnations, not less than 10 flowers of a kind, and is divided into three prizes; the second is offered for the best 5 varieties of cut roses, 20 of a kind, and will all be held as a first prize. It was decided also to call for cut roses on both the first and third day, instead of only on the third day, as heretofore; many who attended the first days were disappointed in not seeing them and commented upon the fact afterwards.

Several members were also appointed as a committee to draw up and have printed a neat circular, announcing the show, giving the principal features and also the special features for each day; these will be mailed to parties likely to attend to the extent of several thousand and will also be distributed to the various retail florists for presenting to customers.

There was a sale of some of the effects of the Elleard Floral Co. at their greenhouses on the 22d. It is reported that the amount realized was very small, stuff having sold very cheap. A novelty for this season of the year is the Cape Jasmine, which has come in from the south; the flowers are on good long stems and are of a better quality than those received in the spring, selling for 3 cents.

R. F. T.

#### Mushrooms and Toad Stools.

Your lively and versatile Philadelphia correspondent, "K," quotes me in regard to mushrooms, in your last issue.

Now, while I do not object to being quoted, I do object to being held up as an authority on mushrooms and toad stools. I am a jobber of mushroom

spawn, but what of that? You would not call a man an archangel though he sold archangel tar, would you? But although I do not profess to be posted in regard to these wild mushrooms I hope no one will think I am so grossly ignorant as not to know that the poisonous amanita which resembles the *Agaricus campestris* somewhat grows in an entirely different habitat—in the depth or on the edge of woods—while the *A. campestris* always grows in the open.

What I did say to "K" was that there were some varieties of mushrooms that resembled the *campestris* and unless one was an expert he'd better stick to the home grown product. I consider it good business for any one interested in the growing or selling of mushrooms to talk in that strain to the public. It would do serious injury to the mushroom business if the public were to run away with the idea that there was any danger from the home grown product.

Your correspondent's intentions were good and I forgive his levity on the score of his youth and innocence and write you this note chiefly to protect myself against the possible shafts of some sharp New Yorker. I have a lively recollection of what happened when "K" reported "The war of the cannas." If, like the Scotch editor, I "jock wi' deefeculty" myself, yet I enjoy a joke well enough if no harm is to come from it, only, hereafter I would like "K" to tell me when I'm being interviewed for publication and when I'm not. It might keep back some chaff and let nothing but the pure wheat get to Chicago.

G. C. WATSON.

Philadelphia, September 24.

WE HAVE RECEIVED a prize list of the fifth annual chrysanthemum show of the Montreal Gardeners' and Florists' Club, which is to be held in Fraser Hall on November 8-9-10. The schedule is quite comprehensive and the premiums amount to about \$500 in cash besides two silver cups.

W. HOBOKEN, N. J.—The cyclone tail end which struck this town the end of August destroyed a number of trees by uprooting. On the place of Mr. Geo. Alces, however, who has some very choice fruits, trees received immediate attention in being raised and cared for. He is rewarded by seeing a young pear tree now *in full bloom*, with just the first signs of young foliage, old leaves all dropped off and one large, fine pear, the only survivor of the storm. This is probably not often seen.

HARTFORD, CONN.—The September exhibition of the Hartford Horticultural Society was held on September 19 and 20. The exhibits of plants, flowers and vegetables were superior. Palms, ferns and stove plants in general made a good show, the principal exhibitors being Geo. M. Atwood and W. B. May. G. W. McClunie made a very pretty dinner table decoration and D. N. Spear showed a good collection of bulbs, etc.

NEWPORT, R. I.—The Newport Horticultural Society has decided to hold its chrysanthemum show on November 6, 7 and 8. This will be the fourth annual show of the society and indications point to a very complete exhibition. The Newport exhibitions are always grand, the material for such enterprises in this vicinity being almost unequalled, and the amateur growers of rare plants, as well as the private gardeners and florists, can always be depended upon to do their best on such occasions.

## SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

**SITUATION WANTED**—In good private place; 15 years' experience; age 25. Excellent references. W. K. care American Florist, Chicago.

**SITUATION WANTED**—By an experienced florist and gardener. Address E. HAY, care Mrs. Josephson, 300 N. Green St., Chicago.

**SITUATION WANTED**—By a practical florist; 23 years' experience in roses and carnations and general plants. Best of references. Address GERMAN, 266 Floyd St., Brooklyn, N. Y.

**SITUATION WANTED**—By a young German with 7 years' experience in the business. Can give good references as to ability, etc. Address ALBERT ULRICH, 217 N. Wells St., Chicago.

**SITUATION WANTED**—By a practical florist, 21 years' experience, commercial or private; good references; married. Address O. E. WOLFF, 214 Euclid Ave., St. Louis, Mo.

**SITUATION WANTED**—By florist; American; private or commercial place; 4 years' experience; age 20; can show good references from the best firms in U. S. Address J. F. care American Florist.

**SITUATION WANTED**—By practical gardener, as foreman or headgardener in commercial or private place; 20 years' experience. Understands orchids. Good references. M. Woodland P. O., Chicago.

**SITUATION WANTED**—A French gardener, of great experience, employed at the Fair wishes a situation, gentleman's place preferred. Can give the best references. Address A. Z. care Am. Florist.

**SITUATION WANTED**—By an experienced seedsman. Thoroughly competent in wholesale, retail or on the road. Particulars and references by correspondence. Address SEEDSMAN, care Am. Florist.

**SITUATION WANTED**—By single young man, as second gardener on private place. Long experience in all branches. First-class references. Address J. MEADE, care Wm. Tricker, Dongan Hills, L. I., N. Y.

**SITUATION WANTED**—As foreman on commercial place; thoroughly practical in roses, carnations and bulb forcing, and all branches of the profession. References. THOS. MCKENZIE, 96 Lindus street, Cleveland, Ohio.

**SITUATION WANTED**—By young man; 8 years experience in growing cut flowers and general greenhouse stock, first class designer and decorator; references given. Address G. B. K. care Fred Engel, Farmington, Fayette Co., Ill.

**SITUATION WANTED**—By a young English speaking German, experience in roses, carnations and general culture, etc.; good recommend from last place, private or commercial in or near New York. Address C. Ph. J., 10 North Bond St., Mt. Vernon, N. Y.

**SITUATION WANTED**—By a practical florist with 9 years' experience in America, England and Denmark; age 25; well up in roses, carnations, smilax and general greenhouse stock. Address CHRIST. ANDERSEN, 225 Milwaukee Ave., Chicago.

**SITUATION WANTED**—A competent florist with 11 years' experience in U. S. and Sweden; well up in growing of roses, carnations palms and general greenhouse stock; good designer; sober and steady; age 20; single. Address G. L. care American Florist.

**SITUATION WANTED**—As foreman or manager; understands growing roses, carnations, violets, decorative and bedding plants, forcing of bulbs; also making up, etc. A life experience; age 33; single. Good references. State wages. D. N. care Am. Florist.

**SITUATION WANTED**—As general foreman and all round grower; has held similar positions for the last six years in this country, and has had a thorough training from boyhood in good English nurseries. Good references. Address H. WESTON, 57 Woolsey Ave., Astoria, N. Y.

**SITUATION WANTED**—By young German in a commercial place, practical and sober; age 25; 8 years' experience; first-class rose, carnation, violet and general cut flower grower; can make decorations and design work of any kind. Can speak three languages, and furnish first-class references. State wages. Address G. care E. H. Hunt, 59 Lake St., Chicago.

**WANTED**—A quantity of second-hand frame sash. State price, etc. Address R. HUGHES, Haddonfield, N. J.

**WANTED**—A first-class fireman; married; no children preferred. ANCHORAGE ROSE CO., Anchorage, Ky.

**WANTED**—Young man as assistant in greenhouse and outside. State experience and wages per month with board. Address GEO. S. BELDING, Middletown, N. Y.

**WANTED**—To go to Florida, January to April, a competent florist, experienced in table and room decoration, woman preferred. Address WAID G. FOSTER, P. O. Box 282, New York.

**FOR SALE OR LET**—A valuable florist establishment near depot. Apply to JACOB MENDEL, Nyack, N. Y.

**FOR SALE**—1,200 feet 4-inch pipe and fittings (Weathered make), as good as new. MRS. GEO. WALDBAUER, Saginaw, Mich.

## 300 CASES

### Lilium Harrisii or Easter Lilies.

#### 250 BULBS TO A CASE. PRICE \$13.50 EACH.

This is a Special Shipment of Extra Choice Bulbs, which have just been received. They range in size from 7 to 9 inches, and are the Finest we have ever imported.

## 100 CASES

### Pure White Roman Hyacinths.

Pittsburg.

Mr. A. W. Bennett formerly of Flatbush,  
N. Y., and more recently foreman for  
James Weir & Son of Brooklyn, N. Y.,  
has been appointed superintendent of the  
new Schenley Park in this city.

This park, which is within twenty  
minutes ride of the postoffice, contains  
432 acres, of which 300 acres were  
donated by a Mrs. Schenley and the re-  
mainder secured by purchase. The site of  
the park is one for which nature has done  
much and with but a moderate expendi-  
ture it can be made one of the most  
beautiful public parks in the country.

The splendid conservatories contributed  
by Mr. Phipps are now complete. They  
consist of a main palm house 142x60  
and 65 feet high, a warm orchid house,  
cool orchid house, fernery, show house,  
stove house, victoria house (circular in  
shape and 52 feet in diameter), water  
lily house (35x84), and plant house. This  
range of glass cost over \$100,000. It  
covers 34,000 square feet of ground  
surface.

In addition to the above a range of  
seven greenhouses, each 200 feet long,  
will soon be built, the plans having been  
adopted and the contract for their con-  
struction having probably been awarded  
at this writing. The greenhouses will be  
at a short distance from the conserva-  
tories. The heating is by steam and all  
through the conservatories there is service  
of both cold and hot water arranged so  
that water for syringing, etc., may be  
blended to any desired temperature. The  
greenhouses will cost \$22,000.

In the park roads have been laid out,  
but little other work has as yet been done.

Mr. Bennett visited Chicago last week  
where he secured the World's Fair tree  
fern exhibit of New South Wales (illus-  
trated in our Columbian souvenir num-  
ber) which will take a place in the palm  
house at Schenley Park along with  
numerous other fine specimen decorative  
plants from the World's Fair and else-  
where.

Mr. Bennett is still a young man and  
with the magnificent opportunities now  
opened to him we shall be surprised if he  
does not make Schenley Park a beauty  
spot that will be a monument to his skill  
and energy for all time.

"TREE FERN."—The specimen you send  
is not in very good condition for identi-  
fication, being but a portion of a frond and  
having only unripe spores, but is proba-  
bly Allantodia Brunoniana, otherwise  
known as Asplenium javanicum.

**— SMILAX. —**

Extra strong plants from 2½-inch pots, only \$1.25  
per 100; \$10.00 per 1000.

## AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

VISITED CHICAGO: J. Roscoe Fuller, Floral Park, N. Y.; B. Landreth, Jr., H. M. Wall, R. A. Robbins, J. J. Harrison, F. De Cou, St. Paul; Thos. O'Neil, with D. Landreth & Sons; A. Tilton, Cleveland; J. A. Simmers.

THE DUTCH Steamer Maasdam, carrying Dutch bulbs, has put back disabled, thus delaying many lots two weeks or more.

CINCINNATI.—The project of a chrysanthemum show in this city this year has been abandoned.

NEWPORT, R. I.—W. A. Vanick, of the Newport Nursery Co., has returned from a European trip during the course of which he visited the leading nurseries of France, Germany and Austria.

HYDE PARK, MASS.—The annual fall exhibition of the Hyde Park Horticultural Society was held on Wednesday evening, September 20. The show was very creditable and in every way a success.

HAVERHILL, MASS.—The display of garden flowers at the seventy-third annual exhibition of the Essex Agricultural Society in this city was very extensive and proved to be one of the best departments of the fair.

BELLEVILLE, PA.—A severe hail storm, fortunately of short duration, visited this town on Tuesday, September 19, at 5 p. m. F. Burki lost three hundred lights of glass. Hartman Bros. also sustained considerable damage.

**Z. DeForest Ely & Co.**  
WHOLESALE SEEDSMEN,  
Growers and Importers of Bulbs.  
JOBBER IN  
Florists' Supplies,  
1024 MARKET STREET,  
PHILADELPHIA, PA.

Reg. Cable Address: DeForest, Phila.  
Price lists to dealers on application.

## Hybrid Perpetual Roses,

Worked low on the Manetti Stock, offer the best results to the florist, blooming freely and giving plenty of cuttings for propagating quickly. Fine plants for sale by the 100 or 1000, at low rates.

Price Lists to applicants. Address

**WILLIAM H. SPOONER,**  
JAMAICA PLAIN, (Boston). MASS.

## Toronto.

The Gardeners and Florists' Association held a lively meeting last Tuesday, which was better attended than the last three or four meetings have been. The final chrysanthemum show prize list was the principal business on hand; there were several pretty close votes which made things quite exciting. As usual of course the smallness of the prizes was brought forward, one member stating that an American friend of his thought that the Toronto gardeners and florists must be a lot of fools to show for such prizes as were offered. Well of course everyone would like to make the prizes higher, and if the association had a good balance at the bank or could fall back on a decent sized guarantee fund they would have been put higher, but as there is very little to fall back on and wealthy men are scarce in the profession, perhaps it is well to go slow at first and make sure of paying 100 cents on the dollar. It is a great deal pleasanter and easier getting up a prize list with lots of big prizes, but it is very unpleasant after the show to have only money enough to pay the prize winners 50 per cent of what they won.

In the two last shows held by the association circumstances seemed to conspire against their financial success, but at present there is no speck on the horizon and it is hoped that a surplus may be realized out of the coming show so that future shows may be run on a firmer foundation. It appears to your correspondent that if the members would do a little more work *altogether* and a little less talking and finding fault with what has been done the success of the show would be assured. E.

I was pleased to see Mr. Ewing's severe criticism of the arrangement and judging of plants at the Toronto Industrial Exhibition and hope it will be the means of a change. The section calling for the best display of plants in pots—what does it mean? If they were judged for artistic arrangement and effect, they had two most beautiful tables, but I certainly condemn the system of huddling together so that only the tips of the foliage are seen. My idea would be to show out clearly the beauty and symmetry of each plant as arrangement now is. There is no incentive to grow or exhibit a good specimen when an inferior article will do, as we can prop them up on barrels, boxes and blocks and hide their deformity.

I would suggest that at the next exhibition a certain number of tables be set apart for artistic effect for another class, call for 150 or 200 plants, best specimen, in pots; leave these two classes open to all; it would increase the prize list, but would pay the directors, as no department at the exhibition was better patronized than the "floral hall."

Another thing wants remedying—that dingy old hall, without light, heat or headroom to stage a specimen plant. With these alterations the exhibit this year would compare favorably with that of any city on the continent.

HOUSTON.

Do YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

Mention the American Florist when writing to advertisers on this page.

# PANSIES.

THE BEST ARE THE CHEAPEST.

My customers say that mine are the best they can buy in all that goes to make good Pansies, **size, color, form and substance.** Try them, and you will say so yourself. They are better this season than ever, and if you don't want more, get a hundred for comparison with others you grow.

The **Plants** are good as well as the strain, and for the asking I will mail you an honest sample. Price free by mail 75 cts. per 100, or \$3.00 per 500; by express \$5.00 per 1000. **Half a Million ready during October.** Cash with the order or C. O. D.

## Recent Legal Decisions.

Damages Recoverable for Freight Negligently Lost or Destroyed.

The measure of damages recoverable for property lost or destroyed through the negligence of a common carrier, as for instance a railroad company, is not limited to the valuation in the bill of lading, though a limit may be imposed upon the liability of a carrier for a loss not occurring through its negligence, and where such a contract is made there can be no recovery unless negligence on the part of the carrier is affirmatively shown. Lang v. Penna. Co. Sup. Ct., Pa., 20 L. R. A. 360.

## At the Convention.

SMITH—Do you think of trying this system of automatic ventilation?

JONES—Naw. Had too much automatic ventilation now to suit me.

SMITH—How so?

JONES—Had three hail storms in two years.

## SPECIAL - \$10.00- OFFER, FOR A LIMITED PERIOD ONLY.

To introduce our specialties we make this special offer of

1 STOTT DISTRIBUTER.

1 STOTT SPRAYER (The best made.)

20 lbs. KILLMRIGHT (Non-poisonous, but Death to Insects.)

FOR \$10 CASH.

Will clean your Greenhouses and out-door plants of Aphids, Mealy Bug, Caterpillar and other insects. Order through your seedsman, or direct of

ENDORSED BY LEADING FLORISTS  
EVERYWHERE.

WITH PROPER USE, SATISFACTION  
GUARANTEED.

TO STOTT GARDEN IMPL'T CO., 136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed, BOLANZ BROS., Akron, O.

**291 AMITY STREET,**  
**FLUSHING, Queens, Co., N. Y.**

## The Edible Puff Ball.

ED. AM. FLORIST:—Through an article in the reports of the Department of Agriculture of two years ago I discovered that the common Puff Ball of the woods is an edible fungus, and last year had many good meals of them, and of late have found and eaten many fine ones; while they are very substantial they are in flavor as dainty as a mushroom. Finding how much good food there is in one I have thought it possible that among the innumerable readers of the FLORIST there might be some one who could tell through its columns if it is possible to cultivate them, and how. W. G. J.  
Ithaca, N. Y.

The Giant Puff Ball mushroom (*Lycoperdon giganteum*) grows hereabout in great abundance, coming up at this time of year in the open fields and in thinly shaded places, but not in heavily shaded woods or grounds, and also in the hard roads, and it is generally known to be not only edible but very good to eat. At the same time it is very little used, not even by those who know of its fine edible nature; in fact the people don't catch on to any enthusiasm in the matter. I know of no systematic attempt at cultivating it artificially. If its cultivation could be readily accomplished persons fond of the puff balls might grow them for their own gratification, but before any serious attempt should be made to grow them for market, it would be well to get the public enthused into using the wild ones, and thereby whet their appetites for the cultivated ones. W. F.  
Long Island.

## Educating the Public.

LADY CUSTOMER—What is the price of this chrysanthemum?

FLORIST'S CLERK—That big one is \$2. It's a fine *crischanthem*.

LADY CUSTOMER—f notice you pronounce the name differently from what I imagined to be correct. Is *crischanthem* right?

FLORIST'S CLERK—Yes mum. Certainly mum. We professionals ought to know mum.

LADY CUSTOMER—Of course. That is quite true. Thank you for your information.

vertisers in this paper please say that  
you saw the advertisement in the  
American Florist.

## Minneapolis.

The floral display at the recent exposition was arranged in three sections; the first—from Monday to Tuesday—was devoted to table decorations and parlor bouquets; the second section—from Wednesday to Friday—to original designs; the third section—from Friday to Sunday—to cut flowers and baskets. The exhibitors were R. J. Mendenhall and E. Nagel & Co. of Minneapolis and Aug. S. Swanson of St. Paul, and though the participants were few in number, the exhibits were excellent and were much appreciated by the public.

Premiums were awarded as follows: Table decoration, 1st, \$100, E. Nagel & Co.; 2d, \$50, Aug. S. Swanson. Parlor bouquets, 1st, \$10, E. Nagel & Co.; 2d, \$5, R. J. Mendenhall. Original design, 1st, \$50, Aug. S. Swanson; 2d, \$30, E. Nagel & Co. Cut flowers, 1st, Aug. S. Swanson; 2d, E. Nagel & Co. Basket, 1st, E. Nagel & Co.

Am sorry to report that there will be no chrysanthemum show here this year. Our society has dropped into a lifeless condition. Hope it will exhibit its old life and vigor again soon, but it is hard to say when this will be. N.

## Flowers as Political Badges.

In a recent election in Vienna the adherents of one candidate adopted a white rose as a distinguishing badge, and their opponents thereupon used a yellow rose for the same purpose, and as a consequence the demand for white and yellow roses during the campaign was enormous. A correspondent writes that this would not only be more pleasing than silken or metal badges but would throw considerable business in the way of the florist if introduced in this country.

## Bulbs and Bantams.

The following adv. was clipped from a daily paper and sent us by one of our subscribers, who thought it would serve to amuse our readers:

**GIVEN EVERY** customer, plants, bulbs, *bantam chickens*; tulip bulbs, blooming size, three dozen 25 cents; plants, bulbs, cut flowers cheap.

### OBITUARY.

MR. HUGH LOW, of the famous Clapton Nursery, England, died suddenly from pneumonia September 17, aged 33 years. He was the oldest son of Mr. Stuart Low, and leaves a widow and two little daughters. He was a member of the committee of the Royal Gardeners' Orphan Fund, but otherwise took no active part in public horticultural affairs. Mr. Low's untimely death is deeply regretted by a wide circle of friends, in addition to the many to whom his name is familiar through business interests.

A PROJECT is on foot to have a mammoth chrysanthemum show at the World's Fair, beginning November 7. Mr. Robt Craig and President W. R. Smith are working the matter up. They have asked the management to appropriate \$10,000 for premiums, and as we go to press the chances of their acceding to this request seem favorable.

### Cultural Notes.

By this date most of the varieties will be ready to disbud, in fact all but a few of the latest will need your immediate attention. Many of those previously disbudded have pushed out lateral growth all along the stem, these should be removed at once if you wish to concentrate all the energy into the bloom.

Where cut flowers are the object, and the appearance of the plant is of no consideration, it is well to remove some of the lower leaves, particularly so if the growth is very gross. You will notice many of the leaves are very much thickened and they will become more so, thereby robbing the flower to some extent of the nourishment you are so liberally applying these days.

One fourth to one half of the lower leaves (according to the height) can be dispensed with, which will not only improve the quality but make it easier to note the condition of the soil, and also, by thus admitting the light and air, evaporation is hastened, which is quite essential as the days shorten.

Some of the early varieties are beginning to show color and in ten days there will be many half expanded blooms. Two or three liberal smokings should be given before color is too prevalent, to destroy all aphids, as tobacco smoke or dust can not be used in sufficient quantity to kill the pests without injuring the flowers when expanded. But light smokings can be continued as a preventive rather than a cure.

Mildew may be kept in check by dusting the plants with sulphur on bright days, and then close all ventilation for a few hours to secure sufficient heat to generate the fumes.

A diary giving date when the buds were taken, and when fully perfected, with their size, and the height of plant, will not only be interesting but instructive, eventually giving very valuable data.

As fast as the disbudding is completed give them the final tying and at the same time see that all buds are kept from the glass, for a few nights freezing will make them worthless.

The knack of knowing when and how often to apply liquid foods is somewhat perplexing even to those who have had experience, and can only be acquired by close observation, as this work must be

governed by the apparent condition of the plants. If all growers were chemists or were capable of analyzing their compost it might be possible after years of careful experimenting to arrive at a definite conclusion which would be practical to all, but as very few of us know the constituents of our soil a precise rule can not be given.

The indications of excessive nourishment are considerably varied in different varieties. When overdone prior to the time for bud formation O. P. Bassett, Ada Spaulding and its seedling Esmeralda, become thickened or stopped, or in other words the joints do not elongate but form a compact mass of foliage at the top of the stem and literally refuse to produce buds at all. When these varieties are desired for exhibition I would advise early propagation and give no other food than that contained in a good compost until after the buds appear, and carefully encouraged thereafter.

Most of the varieties are not as sensitive as the foregoing, although H. E. Widener, Minnie Wanamaker and many others, curl or cup their leaves, while Henry Cannell, Secretary Farson and others show yellow or brown edged foliage, as though maturing with age, when too generously supplied.

When any of these forms are apparent, no matter how slight, let it be a warning, as it is safe to say they have had a sufficiency, but will not necessarily be injurious to any marked degree if discontinued at once.

Adrian, Mich.

ELMER D. SMITH.

### Miscellaneous Seasonable Hints.

You will by this time have your Azalea Indica all housed; I mean those left over from last spring's sales. If you don't want any to flower in midwinter then the very coolest place above freezing is the place for them. It is well to have none left over, but you are sure to have some and you can make good use of them for decorating during winter. If you have such use for them bring them into a temperature of 60° or 65° at night about November 1 and they will be (if they are early flowering varieties) in flower by the Holidays, and they come in remarkably useful for decorations. When subjected to forcing in a high temperature the azaleas are liable to be attacked with thrip and must be daily syringed thoroughly, not overhead like a greenhorn handles the hose, but underneath with an "upper tendency," because the thrip are always on the under side of the leaf. In a few days the imported azaleas will arrive. I have seen the exporter blamed for the non-success of these plants when the fault was entirely with the importer. They arrive invariably in good order with exception that a few leaves drop off

when unpacked. They are in most cases three weeks from the time they are lifted from the nursery beds in Europe until they are unpacked by the florist here, and in inland cities more, and must be quite dry at the roots. When you are ready to pot them the most important part of the job is to have a tub by your side with seven or eight inches of water in it; give each plant a soaking at the root for two or three minutes. This will thoroughly saturate the ball, which is of the greatest consequence. Use for potting a good light loam with one third of leaf mould. You can not pot these azaleas as fast as you can many soft wooded plants; it pays to take time. The great majority of the azaleas now imported are grown in the open ground and when lifted have a large mass of roots that it would be impossible to get into a pot unless it was of a size altogether out of proportion to the size of the plant. So take a well sharpened hatchet and slice off the roots to a size that will suit the size of pot. It does not do them the slightest harm. A space of half an inch all round between the trimmed up ball and the pot is sufficient, and then get the new soil well packed down. You can not do this with the pressure of fingers and thumb as you would a geranium or cineraria, you must have a stick an inch or so broad and a quarter of an inch thick and put in a little soil at a time, thoroughly ramming it down. If this were not done the future waterings would soak through the new soil and almost entirely escape the old solid ball of roots. The best place to put the azaleas when first imported is in a shaded house with a night temperature of 40° to 45° and give them a light syringing daily. Some growers who import these plants by the thousand recommend keeping them for one year before selling them, but for the great majority of florists who import from 50 to 500 of these beautiful little trees it is far more profitable to dispose of them the first year. A good, shapely little plant is landed at your door for about 60 or 65 cents. The following February, March and April they are all sold at from \$2 to \$3. This is doing well enough. You need not reserve them all for Easter, for there is no plant that sells better in midwinter than a compact little azalea. Deutsche Perle, the beautiful little double white, if put in a rose house temperature about December 1, will be in full bloom at Christmas, and if it only lives or flowers a week, has it not been more for the money than a dozen picked over roses?

Now is the time to sow *Centaurea candidissima* if you want it. It seems going out of fashion, yet very effective in some places.

Give the poinsettias the warmest and lightest place you have. In so many places you see them grown by the yard because they are put in a palm house where it is warm, but shady.

As soon as the tops of cannas and *Caladium esculentum* are injured by frost the sooner the better the roots are dry. If you can let them bask in the sun for a day or two after being dry, so much the better. A cellar that will keep potatoes will keep cannas to perfection, but *caladium* roots need it warmer. The floor of a rose house is just the place. But don't put them on the ground, or the moisture will start them growing; place them on boards to keep them off the ground.

Buffalo, Oct. 2.

WM. SCOTT.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

CANNA MME. CROZY.

#### Cannas.

The continued improvement in ornamental flowering cannas leads to the establishment of a certain standard of perfection, and it is necessary that raisers of new varieties keep this standard in view. In spite of the many new sorts introduced Mme. Crozy still stands at the head, and is pointed out as a model by those who have made these plants a study. On referring to the illustration of Mme. Crozy, on this page, it will be noted, first of all, that the petals are broad; they average one to one and one fourth inches across, and they occasionally reach a width of one and one half inches. The coloring is not only brilliant and distinct, but it stands exposure without bleaching or fading. The texture is firm. Instead of forming one spike only the flower stalk branches, and after the main spike has done blooming it may be cut out, leaving one or more laterals to take its place. This insures abundance of bloom. The plant is a constant bloomer, keeping up a succession of flowers all through the season. It will be seen that in general excellence this variety is not excelled by later ones; it is still indispensable and should be a valuable seed parent.

The spike of Florence Vaughan, figured on page 191, is longer than Mme. Crozy, without its rounded appearance, but it has the same tendency to branch off into lateral spikes. In the picture the side

spike will be noted, undeveloped yet, but ready to bloom after the older spike. The flowers are wide-petalled and firm, inclined to lap over one another a little, and the coloring is very rich. A free bloomer, with fine habit and robust constitution.

J. D. Cabos, which is shown on page 192, is a good variety, but not so good, according to our standard, as the two first named. The petals are of good width; they open very wide, curving backward to their full extent. This gives a showy flower, but is not a shape calculated to stand being battered about by high winds. The texture is thin, and the color, orange shaded with apricot, is inclined to fade under a strong sun. Still, we are inclined to call Cabos the best of its color; it is an abundant bloomer, and makes a fine show when bedded in a mass.

Columbia, figured on page 193, is a new American seedling, which has received high praise; the picture does not really do it justice, the flowers being crowded so thickly on the stalk that they do not show to advantage. This close massing of the flowers is considered by some good authorities a great advantage, since it gives the flowers more security against battering by rough wind or rain, but carried to excess it must cause the spike to lose some of its elegance. In Columbia the petals are very large, both long and wide, and slightly overlapping at the sides. The texture is very thick and firm, the color a rich red. This is a very pro-

CANNA FLORENCE VAUGHAN

lific bloomer and vigorous grower, and is generally conceded to be a decided advance.

In the individual flowers shown on page 195 the various peculiarities before mentioned can be noted more particularly. J. D. Cabos and Columbia show as the very antipodes of each other. In Cabos the petals roll back, making a very open, spreading flower; in Columbia they scarcely reflex at all, and the straight up and down style of the flower takes off the breadth of the petals. But this shape gives great firmness to the flower, and it is very lasting. In Florence Vaughan we have the wide petals, reflexed, but not as much as Cabos, a shapely flower, distinct in character as in color. In the unnamed flower to the left of Columbia we have a prevalent type which should be avoided, rather long, narrow reflexed petals, easily twisted or broken. It is not the poorest type of flower, but it is a style that can not hope to compete with better ones. For the flower width of petal is essential, and excellence of color alone can not make a useful plant. These points should be borne in mind by those who are striving for improvement in these plants.

#### Palm Growing for Profit.

The areca has become such an indispensable palm that no florist's stock is complete without a number of them, and there are establishments where house after house is filled entirely with this fine variety. Popular as it is, however, it has to divide honors with the latania, which variety pushes it very hard for first place in public favor, while the kentia is fast becoming a rival of both of them.

At Mr. Chas. D. Ball's establishment, Holmesburg Junction, Philadelphia, these palms may be seen in perfection. There are all sizes and degrees of growth, from seedlings to specimens, and all in perfect health. As a rule each variety has a house to itself, the larger plants occupying the center, while the younger stock fill up the side benches. The areca is Mr. Ball's best palm, and his stock of this variety is very complete. In speaking of arecas during a recent visit to his place he said:

"I grow a great many single plants, but the majority are now started right from the seed pan three together in a pot, care being taken to put different growths together, so that when they grow up

they will make a more symmetrical plant. Those started in this way after they have grown up can not be distinguished from the single plant that has sent up side shoots. Pots made up from plants a year old never look as well. While I prefer a naturally grown plant I have been compelled to adopt this grouping of plants together, as they make what appears to be a fine bushy single plant much quicker than by the old method. Frequently, too, a single plant will grow very tall without sending up side shoots, making a poor specimen; I have known such to branch out after checking their growth, but as a rule they have to be sold at a reduced rate. Of course this does not matter in the made up plants, as if one does grow tall the others are likely to be bushy, and the result is a fine clump."

"Did you ever try two or more latanias together in one pot?"

"No, I never could see anything in putting latanias together, a well grown specimen is quite bushy enough. What better could anyone want than that?" said he, putting a fine specimen in an 8-inch pot on the floor. "There are twelve leaves on that plant, and if another had been growing with it I am sure it would never have made the saleable plant which this is. I have grouped together Caryota urens, as well as Seaforthia elegans, with excellent results, which I will show you in another house, but I will continue to grow latanias one plant to a pot."

The latanias in this house were very fine, being in 8-inch pots, with from eight to twelve leaves. "How long does it take to grow such plants as these?"

"They were in 4-inch pots this time last year."

"One would hardly think you could get them up in that time."

"Well, I don't know how it is, but this palm always seems to grow very rapidly with me, yet I don't force it, giving whenever possible plenty of air, as I do to all my palms. I believe plants are like people, they require lots of fresh air, and I find it pays to ventilate; even if by keeping the houses close I could get a more rapid growth I would not get as stocky plants."

"What kind of pots do you use?"

"Regular standard up to 6-inch, and hand-made above that. The hand-made is a neater looking pot and fits into the fancy china jardinières and vases much better than does the standard, and I think they are stronger. The machine-made pot is very thin at the rim and frequently a piece breaks out, then the pot will not hold water and the plant suffers."

"This is the time of the year when palms make their growth, or I should say from the latter part of August to first of November; the pots are full of roots and they send out leaves quite rapidly."

"How about heat in summer?"

"I fire very little, only when the weather changes suddenly, and then I always keep some air on."

A house full of latanias in 4-inch pots were as Mr. Ball put it "anxiously waiting to be potted on." Although Mr. Ball enlarged his glass by adding some 8,400 feet the past summer, he is much cramped for room. His stock is moving lively, and sales are fully up to his expectations, but the young plants keep coming on and are soon put in the vacant places.

"This bench is full of the caryotas and seaforthias I spoke about a while ago." They are very nice plants and the first of the kind we had ever seen planted in this way.

Thousands of ferns were seen in a range of smaller houses. Mr. Ball grows quite a stock of ferns, and among others has a nice house of that aristocratic fern *Adiantum Farleyense*.

"This variety is sold now at least fifty per cent less than it brought a few years ago; it is no trouble to grow now, the only trouble being in keeping enough plants over for stock. I find that for stock plants it is best to have the soil very light; this makes the plants grow bushy and there is more to divide, but in plants for sale it is best to put them in good rich loam without peat, and the foliage then takes on a rich, luxurious appearance, and the fronds grow much longer, and a salable plant is the result, in a comparatively short time. I found a fertile frond the other day, which is quite unusual with this variety."

"How do you keep fern seed?"

"In wide mouthed bottles; after it has been gathered for about a month we shake it from the fronds and put the clean seed in the bottles, cork it up tight and it will keep perfectly good for quite a long time."

"Your houses are built and heated somewhat differently from others about here, are they not?"

"Well, I don't know about that; I use brick walls exclusively in building my houses, as I believe it pays in the end, and I use cement instead of mortar. I have one house that has been up sixteen years and has never had any repairs made to it as yet, except the posts supporting the ridge pole rotted off at the bottom, and had to be pieced out. I heat with hot water under pressure and believe it to be the best and most economical. I use Hitchings boilers, with two large expansion tanks raised about thirty-two feet above in the top of the shed, and this gives ten pounds pressure. Two four-inch pipes carry the flow and return to the houses, then they are reduced to three-inch, and along under the tables I use two-inch pipes connected with ordinary manifolds. There is a rise of one foot in a house, starting from the lowest point to the highest and the return is taken back directly underneath the flow. I have never had any difficulty with this system. There are small pet cocks at the highest point in each pipe, but they are very rarely opened, as the air gives us little or no trouble. I like it much better than any steam system I have ever seen and believe it will be generally adopted when its merits are better known."

K.

New York.

"How do you find business?"

"Not steady yet. Picking up a little." M. Hart.

"Well, it's no use to find fault; they say I'm always kicking. Plenty of shipping orders, but look at that stuff; sure you can't send that to anybody." Jas. Hart.

"Hasn't started up here yet. When we get some cooler weather it will improve. There is no good stuff yet." F. D. Hunter.

"All right today. Dull, as a rule, though. Stock shortening up some; that's what helps us." W. F. Sheridan (with broad smile).

"Not started up much yet. Got our first double violets yesterday; good ones, and grown by a carpenter too." W. H. Gunther.

"All cleaned out." Frank Millang (pencil behind ear).

"I feel sick. Prices too high for me." J. Weir (sitting on safe and swinging his legs).

CANNA J. D. CABOS.

"Good one day; rotten the next." John Raynor (in shirt sleeves).

"I've got no fault to find." John Young.

"From what standpoint would you like me to answer?" T. Young, Jr.

"Fully up to the mark for orders, but no cash." A. Herrmann (making movement with fingers to represent handling cash).

Carnations are becoming more plenty. Tuberos spikes are abundant and bring less than two cents a spike. Asters are about finished. Chrysanthemums will appear in a few days. Forsterman, Dailedouze and others will begin to cut a few early ones this week. Forsterman's early specialty is October Beauty. Over at Dailedouze Bros' place at Flatbush is a house of Early Snowball with flowers already half opened. Kate Brown, largely advertised as the earliest white variety, is far behind Snowball here. Mrs. J. G. Whilldin is regarded by Mr. Dailedouze as the best early yellow. Vivand-Morel, Minnie Wanamaker, Ed. Hatch, Mrs. Jerome Jones, Dr. H. Maudeville, Ada Spaulding, Mermaid, Maria Simpson and The Queen are all looking splendidly. One bench contains 125 new varieties. The most robust and sturdiest looking variety in the whole lot is Pres. W. R. Smith, which is certainly very appropriate. Golden Wedding is sick and in this case at least is good for nothing. Ernst Asmus reports the same experience with this variety. O. P. Bassett is another unsatisfactory kind. It goes blind. Ed. Hatch does not take

after its namesake, for it is very tall, in fact is quite a climber. For late yellow, Mr. Dailedouze grows Dr. Covot. He has discarded all roses except American Beauty, of which he has four houses in fine condition. In carnations, Daybreak, Edna Craig and Puritan are favorites. Mme. Albertini is in bloom, a good sized flower, but in color and form no match for Edna Craig.

Another Flatbush celebrity is G. Bergmann, who is located on Lincoln Road (not Pigtown). Mr. Bergmann has recently returned from Europe. On a recent call he was found to be working hard. Cyclamens are his great specialty, and they are in grand shape. Plants one year old are from twelve to fifteen inches across, in six inch pots and are full of buds. There will be some fine chrysanthemums here; Widener and Ivory are particularly promising. Mr. Bergmann is troubled a good deal with ants, which eat the bark off the chrysanthemums just at the surface of the soil and kill the plants. Other growers in the vicinity have been annoyed in the same way. Mr. Dailedouze places a bone among the plants. The ants gather on it and are then easily destroyed. *Dracena terminalis* has always been grown in quantity by Mr. Bergmann, but his plants have become so infected with a spot, apparently fungus, on the foliage, that he will be obliged to abandon their growth entirely. Carnations Grace Wilder, Lady Emma, Puritan, McGowan and Daybreak are all fine here.

Over at Chas. Zeller & Sons' the great

CANNA COLUMBIA.

specialty is orange trees. These little plants, in six and eight inch pots and bearing from twelve to eighteen little Mandarin oranges each, are exceedingly decorative and there is a tremendous demand for them. They are struck from cuttings and take three years before they are in full fruit and ready for market. Zeller's primroses are said to be the best in the country. He has a novelty in the shape of a variegated foliage variety which came from seed two years ago. The variegation is very distinct and it makes a showy plant. The flower is white.

Gus Messeberg's chrysanthemums are in fine condition. Golden Wedding seems to do better here than with Dailedouze, Widener also. Harry May is not growing as strong as last year. Ada Leroy, Niveus, Mermaid, Jessica and Frank Thompson all look first class. A rare sight nowadays is a fine bench of Bennett roses. Grown as Mr. Messeberg does it, it stands in first rank yet. He has in former years been a large grower of tulips, but like many others has about abandoned them as no longer profitable. Mr. Messeberg says that the recent cyclone played a funny trick on him. It blew the bottom out of a dump cart, and he has never seen a trace of the bottom since.

Mr. P. Bruno Meissner, who has been dangerously ill, is greatly improved. At one time his chances looked pretty slim.

Julius Roehrs, Theodore Roehrs and J. M. Keller have gone to Chicago in company with Mr. Seyderhelm of Hamburg, Germany.

John Young has got pretty well settled now in his old quarters at 53 West 30th street, and business has made a good start with him.

The schedule for the chrysanthemum show at the Industrial Building is now ready and copies may be obtained by addressing John Young, secretary, 53 West 30th street, New York. Quite a number of entries have already been booked.

W. S. Rogers, a former employe of Pitcher & Manda who forged checks in their name, has been arrested at Bridgeport, Conn.

#### Philadelphia.

The nights have been quite cool the past week, and there have been light frosts in low places, but not enough to do damage to the bedding. Some growers say that a good hard frost is just what is needed at this time to start things off with a vim.

Business is improving and while there is nothing special to make note of the increase in trade is quite observable. Prices remain about the same, accounted for by the fact that more growers are coming into the market every day or two and next week will no doubt bring in the balance. There are some thirty to forty growers and probably more, and their number is steadily increasing, who bring or send their own men in with their stock every morning. This is peddled from store to store until it is all sold or the trade is supplied, and the balance, well,

the least said about the balance the better.

Now we contend, always have contended, and will continue to contend, that this is no way to manage a business of such magnitude as ours has grown to be. When there were but a few growers outside of those who had stores themselves, it was an easy matter to dispose of their stock, but as they increased the hustling began and now it is quite a common thing to see six and eight of these peddlers in a store at one time, each with a big basket or two or a lot of boxes, while out front will be seen a row of wagons. We believe that at least half if not more of the growers reach the city by rail, and as the two depots are right in the center of the city and only a few blocks apart, would it not be better if they would get together and agree upon a location, somewhere near these stations, bring their stock to this center and make the dealers come to them? The little gimcrack arguments that are offered against this scheme, are mere nothings, while the benefits that would accrue to both grower and dealer alike are inestimable. In New York, Baltimore, Boston and Chicago, where markets have been established the results are very satisfactory, and those who have held back and were afraid that a movement of this kind would be only an experiment need have this fear no longer. Very few flowers are controlled by commission men in this city, but if they would join in the movement it would be greatly to their interests to do so. Any information regarding the benefits to be derived, or the advantages such a method would have over the present system, can be obtained by any one interested, if he will put on his thinking cap and go off by himself and meditate. When the light begins to dawn, let him go and speak to his neighbor, we believe all the growers hereabouts are on speaking terms, in fact most of them have a shaking acquaintance with one another and have been known to work together with a will in matters of trifling importance when compared with this question. Then if two or more think well of the movement, let them call a meeting of their brethren and in a few days the whole matter will be arranged and they wonder why they didn't do it long ago.

The best teas are bringing \$5 per hundred, the seconds and smaller ones \$2 to \$3. Beauties and Belles from \$1 to \$2 per dozen and at times the market is well supplied; quite a few growers have not commenced to cut these roses yet preferring that these crops should come in a little later. Carnations are still 1, valley 4, smilax 12 to 15.

"When will you have chrysanthemums?" is now an everyday question in the stores, and is a hard one to answer. Most of the growers say anywhere from the 7th to the 15th will be the earliest. On all sides comes the report. "We never had them finer," and some say they will excel all previous stock they have ever had.

The special decoration of Z. De Forest Ely & Co's window is certainly deserving of mention, as the effect is very showy and attractive. The bottom of the window in the front is covered with buckwheat chaff, and all kinds of bulbs are arranged on baskets and trays one tier above another from the center, back. In the chaff beds of different shapes are laid out and filled with bulbs, each variety having an artificial plant of its kind in flower in the center. As a back ground to the whole, an oil painting of a large garden, beautifully laid out in beds filled

with spring blooming bulbs in full flower is to be seen. It is fashioned after the depressed bed in Fairmount Park and the horticultural building is to be seen in the distance. The whole effect is very fine and the window attracts a great deal of attention.

Their neighbor H. F. Michell, a few doors below, has also dressed his windows up in good style. Both firms report business very good and particularly so in bulbs, in which line they say their business has increased very much.

What a fellow that George Campestris Watson is, to make such a fuss about so small a thing as a foot or two. We all know that woods don't grow in meadows, but they often do grow just alongside, and as he says the deadly Amanita is found on the borders of the woods and the good mushrooms in the meadows which may be right alongside, why,—well we won't say anything more except that we will thrash him again some day soon and get some "more wheat to send to Chicago."

Daniel D. L. Farson is in bed with pneumonia, having been taken sick on the 23rd; he is getting along all right however, and hopes to be about before long. The chrysanthemum show is at hand, and he says he expects to be all right before that time. K.

#### Chicago.

There are some signs of reviving trade, though there is not much doing yet. Prices are stiffening, though they do not show any great advance. Outdoor stuff is nowhere, so that the stock practically consists of roses and carnations. The recent sharp frosts have cut down the remaining stuff outside, though the continued dry weather had previously ruined the bloom. Cosmos, usually so plentiful, is practically non-existent, and dahlias are too scarce to be quoted. Tuberoses are better than they were. Valley, though not of extra quality, brings \$5. A good many roses are suffering from mildew, owing to the cold wet weather, and few growers have been using fire heat yet. Carnations are generally rather poor, as the plants have not yet become established inside. Chrysanthemums are not yet in. Orchids are more in demand for finework; Corbrey, who makes a specialty of these flowers, reports large orders recently. These orchids come from out of town.

Society is beginning to amuse itself, and some good decorations are looked for. Jos. Curran has to decorate a reception given to Miss Susan B. Anthony next week, where the material is to consist entirely of orchids and Asparagus plumosus. Walter Krcitling had a large decoration on last Tuesday, and P. J. Hauswirth gets a good many receptions and banquets of the World's Fair officials. Autumn weddings are beginning, so prospects are brighter all round.

Oscar J. Friedman has severed his connection with the Gallagher Floral Co. and has started in business for himself at 4 Jackson street, under the Leland Hotel.

Recent visitors: Geo. W. Schroyer, Lancaster, Pa.; Robt. McLeod and wife, Newport, R. I.; Wm. R. Smith, Washington, D. C.; Robt. Craig, Philadelphia; V. V. Eggleston, W. R. Jackson, Orlando, Fla.; C. A. Kuehn, St. Louis; L. Reynolds, Sarnia, Ont.; T. C. Joy, Nashville, Tenn.; W. A. Hanft, St. Louis; Geo. F. Crabb, Grand Rapids, Mich.; E. H. Krelage, Haarlem, Holland; F. A. Baller, Bloomington, Ill.

At the last meeting of the Florist Club

a committee was appointed to take steps to counteract certain political influences that seemed to endanger the proper administration of certain of our public parks. The appointment of such a committee was warmly approved by the club and war has been declared upon a certain low grade politician who has been most active in exerting the injurious influence noted. This seems to be a direction in which the club has not been sufficiently active in the past.

Outside of the above nothing but routine business was transacted at the meeting. Visitors at the meeting included Mr. U. J. Virgin, New Orleans, and Mr. J. A. Kramer, Marion, Iowa.

President W. R. Smith and Robert Craig are both in the city.

#### Boston.

One of the private establishments in the neighborhood of Boston, of which but little is heard, but which is fully as worthy of fame as some that are much better known, is that of Geo. A. Nickerson, of Dedham. The gardener is David Monteith, whose retiring disposition is mainly responsible for the fact that the place is not more prominently known, but who when once he gets you out there proves to be as truly hospitable as he is eminently skillful as a gardener. Here it is that the finest crotons in this vicinity, and probably in the country, are to be seen. They are magnificent big specimens, and unapproachable in color. In grapes, too, Mr. Monteith excels. One house just now is a sight worth seeing, twelve varieties being at present in full perfection.

Dedham is one of the oldest settled towns here and is full of fine old estates beautifully wooded, and the streets are overshadowed by grand old elms, maples and lindens. There are white pine groves evidently of the old original growth which give to all the surroundings a character which can never be artificially produced in open or newly planted sections. Mr. Nickerson's estate is particularly attractive in this respect. There are extensive plantings of rhododendrons and other shrubbery, which add to the natural beauty of the place, and the flower garden is very brilliant with hardy herbaceous and annual flowers.

Cut flower trade remains as at last report, and but little activity can be noted as yet, although the retail florists are preparing for the fall campaign by making their windows as attractive as possible. The growers meanwhile are watching hopefully for the killing frost which will put an end to outdoor bloom and put prices "where they belong."

The plant auctions continue with varying success, good stock in palms, carnations and violets bringing good figures and small miscellaneous stuff going for a song.

W. E. Morton, of Portland, Me., H. F. A. Lange, of Worcester, and Wm. Appleton, Jr., of Providence, R. I., were all visitors to the Hub on one day last week.

#### Buffalo.

There is no great abundance of flowers of any kind at the present time. Roses are the most plentiful. There is a great scarcity of white carnations, but that will soon be over, for there were never so many planted in this vicinity before, and mostly all intended for the Buffalo market. There has been no remarkable revival of business, yet it is steadily growing larger and the annual crop of October weddings is coming in with good promise.

Mr. Stewart, late with W. J. Palmer & Son, will shortly open a store in the busy part of Main street. We shall soon have retail stores enough, but there is always room on top.

Last week a good few of the craft were occupied in avoiding and dodging the company of Mr. George Fancourt of Wilksbarre. He was returning from the World's Fair and got off the train here for a few hours (one hundred and twenty altogether). In company with half a dozen of the Buffalo men he visited Corfu, where he interviewed all the carnation growers, W. S. among the number, missed apples in the air with a shot gun and participated in several other sports known to both town and country. Another day was spent in the city and by that time the beauties of Buffalo had so overpowered him that he was determined that Mrs. Fancourt should also enjoy them. A telegram brought the good lady to the shores of Lake Erie and after a day at the Falls, and another spent socially at the houses of the local florists, they betook themselves to the coal regions, both expressing themselves as delighted with Buffalo. A visit from Mr. Fan. is very refreshing but they are too much like the famous story of the Carolina governors, they are "a long while between."

Mr. Ingram, of Messrs. Hugh Low & Co., paid us a pleasant visit. He was in the best of spirits and did not then know of the death of Mr. Hugh Low, of which I have just heard. This Mr. Low was named after his grandfather, the founder of this great firm.

The writer has not had the pleasure of an interview with W. J. Palmer, Sr. since his return from his European trip, but he is at home this three weeks and feeling well and says he had a "great time." He is reported to have gained seventy pounds in weight.

Very few of our florists have yet visited the World's Fair, but they are waking up. Mr. J. H. Rebstock and Miss Rebstock start to-day, and next week Mr. W. Belsey and wife and W. Scott undergo the ordeal, and several others are expected to join the pilgrimage. W. S.

#### St. Louis.

As was expected several cool days following the rain storm of last week shut off the supply of flowers of all descriptions, and for several days there was not enough to go around; this strengthened the market and roses took a slight advance; at present, however, the thermometer is up around 80° again, and if it continues for any time all will be back at summer prices. The prospects for the coming week are fair; the annual ball of the Veiled Prophet has created the usual demand and several heavy orders have been placed in consequence.

Meteors, which have been coming in quite freely, have suddenly slackened off and are hard to get, and it looks as though a scarcity of this variety during the season can be looked for. Some fair flowers of Kaiserin and Testout are in the market; it is rather early in the season, but from present indications Kaiserin will take well, while Testout will have to rank with La France and Albany, which do not take any too well here.

Mr. C. A. Kuehn, one of our wholesale florists who is better known probably as a manufacturer of wire designs, was married on the 23rd and left immediately for Chicago with his bride, where the couple made a short visit. The affair was kept very quiet and came as a surprise to his

J. D. CABOS

FLORENCE VAUGHAN

UNDESIRABLE TYPE—PETALS TOO NARROW

COLUMBIA

CANNA FLOWERS. THREE-FOURTHS LIFE SIZE

many friends in the trade; all, however, wish him joy. Mr. and Mrs. Benton, who have been away, have returned and on the 26th tendered a reception to their friends.

R. F. T.

#### Indianapolis.

At the monthly meeting of the Indianapolis Florists' Club the question of fire insurance was discussed. It was found that very few members insure their places against fire, partly on account of the

high rate charged, which runs from \$2.25 to \$3.50 in this city and vicinity, and partly because many companies refuse to accept risks on greenhouses. The S. A. F. committee ought certainly to accomplish much toward doing away with the unjust discrimination against greenhouses by the fire insurance companies.

A paper on "Impressions of the Horticultural Department of the World's Fair and the beauty of Chicago parks" was read by Robert McKeaud. He handled the subject admirably and many members

who have attended the Fair were in accord with his views. It is to be regretted that there were no displays of floral work at the Fair. The trial made by the Chicago Florist Club was in the right direction, but the premiums should have been given by the World's Fair management rather than the florists' clubs.

A committee was appointed to confer with the Board of Public Works in regard to space for plants and flowers in the new market annex soon to be built.

The secretary of the Society of Indiana Florists reported that everything was in good shape for the coming chrysanthemum show to be held in this city November 7 to 11. Local chrysanthemums are in excellent condition, the dry weather having had little effect on them.

The Indiana State Fair, held in this city recently, was a financial failure, but premiums will be paid in full. All third premiums were cut off the list this year. Of the principal premiums Anthony Wiegand won firsts on palms, ferns, foliage plants and display; Bertermann Bros., for funeral design, bouquets, cut flowers, original show design and gladiolus; John Rieman & Co., for baskets and original funeral design; Chas. Wheatcroft, for geraniums and hanging baskets; W. W. Coles of Kokomo, for cut roses. The amateur class was well represented, and a few things shown in this section were excellent. The fruit display was very poor. The one judge system having been tried several seasons has proved a failure, at least in this department, and the management will probably return to the old plan of three judges.

Encampment week made very little difference to the trade. Altogether the season has been the dulllest in the history of the trade here to the best of the writer's knowledge.

A shipment of bulbs from Holland, amounting to fully \$800, was sent C. O. D. to a local seed house, which refused to accept them. The R. R. Co. and the shipper finally compromised and delivered the bulbs for 50% of the original bill. These bulbs will probably be unloaded on to the local market at very low rates.

The complete premium list and program for the seventh annual chrysanthemum show will be issued about Oct. 15.

W. B.

Toronto.

The weather has been considerably cooler here this last week and the tender sorts of coleus have been pinched where they stood in exposed situations.

The revised and final prize list of the Toronto Gardeners' and Florists' Association's fourth annual chrysanthemum show will be published this week and forwarded to members, secretaries of other clubs and many others interested. If anyone is left out or wishes for a list it will be forwarded on application to A. H. Ewing, 85 Carlton street, Toronto, Ont. As will be seen there is quite a little stock of silverware to be competed for this year and the competition is likely to be keen. It is reported that *some one* is coming over from Buffalo who is to knock everything grown in Toronto into a cocked hat. I am sure that the association would only be too glad to receive a dozen entries from across the line; they would be quite a drawing card, but I wish to recommend those entering not to build too much on the cocked hat business. But come along gentlemen, try your luck. You will be most welcome.

Mr. Thomas Manton, who has been looking after the Ontario floricultural exhibit at the World's Fair, is about to return home and Mr. Kilvington, a Hamilton florist, will take his place for a short

time, when he will be relieved by our genial friend F. G. Foster of the same ambitious city.

vasseur & Sons, Ussy, France, plants,  
trees and shrubs.

G. M.—We do not print articles from  
writers unknown to us. And even had  
you signed your full name and address  
we would not care to print the article in  
its present form. We would, however,  
be glad to print a description of the exhi-  
bition held in your city.

When sending us newspapers contain-  
ing items you wish us to note please do  
not fail to distinctly mark the item so it  
can be easily found, as we can not spare  
the time to hunt through the mass of  
papers sent us for unmarked items.

When writing to any of the advertisers  
on this page please mention the AMERICAN  
FLORIST.

Philadelphia.

Chrysanthemums at W. K. Harris' are looking well. He makes no special effort to get early blooms, believing that there is more profit and less competition in the late croppers. Eldorado, which used to be his best early yellow, does not grow well for him now, he says, and he will discard it hereafter. One bad fault with this variety is the stiffness and brittleness of the petals, which are apt to break off with any rough handling. Mr. Harris has only about 65 seedlings this season.

No prettier sight can be imagined than Mr. Harris' houses of rubbers. Having been taken in from outside but recently the tops have that rich red color which comes from plenty of sunlight, and makes these plants so much more attractive. Most of them are in those famous plate glass houses, and not a speck of blister or burn is to be found on them, and Mr. Harris is confident that his theories will be supported by the results, even though his facetious critics accuse him of having "more money than wit." His Edna Craig carnations are in splendid shape, as are also the McGowans. These are the only carnations he grows with the exception of a few odds and ends, among which are two very promising seedlings of last year.

DETROIT, MICH.—It has been decided not to attempt a chrysanthemum show in this city this year.

FRAMINGHAM CENTER, MASS.—William Nicholson has built a new house 150x20 for carnations, heated by steam.

BAY CITY, MICH.—It has been decided by the Bay County Hort. Society not to give a chrysanthemum show this year.

WORCESTER, MASS.—Lars J. Lundblad, who has for the past fifteen years been gardener at the Lunatic Hospital grounds here, committed suicide on September 25, by shooting himself. The cause assigned for the act is despondency. He leaves a wife and three children.

SOUTH WEYMOUTH, MASS.—The annual fair of the Weymouth Agricultural and Industrial Association was held during the past week. The horticultural department was not as well filled as in previous years, but the flowers, fruits and vegetables shown were of excellent quality and creditable to the exhibitors.

Snowflake Daisy, double white, \$1.00 per 100.

Longfellow Daisy, double red, \$1.00 per 100.

F. A. BALLER, Bloomington, Ill.

Had Felt the Influence.

LADY CUSTOMER—What a charming occupation yours is! It must be so refining to be in constant contact with the elevating influence of the most lovely creations of nature!

FLORIST—Yes indeed ma'm.

LADY CUSTOMER—What on earth is that awful racket?

FLORIST—Oh, nothing serious ma'm. One of my men came into contact with too much liquid refreshments again this afternoon, and the noise indicates that he has fallen into the stoke-hole and is expressing his opinion about the matter. He is a thoroughly competent man when he's sober. Been at the business all his life. And I hate to let him go, but will have to if these lapses come much more often.

LADY CUSTOMER—(Very thoughtfully) Oh!

A Terrible Danger Discovered!

"Don't put rose stems in your mouth, at least those raised in hothouses. Nearly every stem has poison on it, put there to kill bugs."—J. C. in *West Chester (Pa.) Local News.*

25,000 PEONIES.

ists. All parties wishing to procure copies of either  
or all of these can have them by applying and enclos-  
ing 25 cents in stamps for each, as long as they last.

Address **WM. J. STEWART, Sec'y,**  
67 Bromfield Street, BOSTON, MASS.

Miscellaneous Notes.

The following pointers were picked up at the establishment of Mr. W. N. Rudd, Mt. Greenwood, Ill.:

He has a house of *Asparagus plumosus*, and it is the most profitable crop he grows. He cuts five crops from the beds in one season and sells every bit that is cut and at a good price. He feeds it heavy and gives it a night temperature of from 65° to 70°.

Wootton is his most profitable rose. He runs it cool—a night temperature of 50°—and disbuds to get fine flowers.

Freesias didn't sell well a few years ago, but now there is a good demand for the flowers and he finds them a very profitable crop. But he cuts the whole bunch from each bulb. The flowers alone, without the foliage, won't sell.

He burns no more tobacco for fumigating. Under the center bench in each house he has a tub near a valve with a connection that lets steam into it. He fills the tub with tobacco stems, turns on the steam and lets it run as long as seems necessary. He could never discover that the steam did the slightest damage to any vegetation in the house and the aphid tribe never gets a start. He wouldn't consider a proposition to return to smoke or to bundles of stems, etc.

He uses a Champion soil pulverizer and sifter, made by E. E. Wolf, Springfield, O., and advertised in the *FLORIST*, for preparing his potting soil and is loud in his praise of its efficiency and usefulness.

THE AMERICAN FLORIST and *Gardening* together to one address for \$1.75. Send orders to the American Florist Co.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Doppf & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Doppf and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

## TO TAKE PLACE OF WIND MILLS

## HOT AIR PUMPING ENGINES

### A Windmill

Is unreliable because it depends upon the elements for its power; hydraulic rams also depend upon favorable conditions and waste as much water as they secure. Steam pumps require skill and hand pumps demand labor and time. The

DE LAMATER-RIDER OR  
DE LAMATER-ERICSSON

Hot-Air

Pumping Engines

are especially designed for pumping water, and from shallow streams or any kind of well. They are simple, safe and reliable, require no steam and have no valves. They require very little heat to operate them, and can be arranged for any kind of fuel.

Send for illustrated catalogue to

THE DE LAMATER IRON WORKS,

87 South Fifth Av.,

NEW YORK, N. Y.

## THE CHAMPION

### Automatic Ventilator

The cheapest, easiest to operate, and by far the best machine in the market. Don't buy a Ventilator until you have seen my illustrated descriptive circular, which will be sent you free, giving prices, etc. Also Champion Soil Pulverizer and Sifter.

Address, **E. E. WOLF,**

Box 114.

## Fire Insurance.

The question of fire insurance on greenhouses and stocks has often suggested itself to me. The plan of having a florists' fire insurance company after the plan of the Hail Insurance Co., has presented itself to me as a feasible one now that greenhouses are almost as numerous as barns. Of course the plan would need to be modified. Each section would have to be represented for the purpose of insuring property and also in making up fire losses. Such a position would require a man of ability and good sound judgment of human nature. As to rates, they might be graded, or if a place was extra hazardous, double rates might be demanded, but, better still, let such places alone. As an indication of what mutual insurance costs, I will state that I carry \$2,000 insurance in two mutual companies. The assessments hitherto have amounted to about \$10 annually. I had this insurance placed when I had about 8,000 square feet of glass. Since then I have enlarged the glass area to 18,000 square feet and erected other buildings. I have as yet made no application for additional insurance, as I can hardly see how a fire could destroy the place, as there is not enough of wood work in one place to cause much of a blaze; and, besides, none of the wood work ever gets heated. There is scarcely a single hot water pipe in contact with the frame part of the buildings. Properly built greenhouses are a good risk for insurance people, and as such is the case let us have at once a florists' fire insurance company on the assessment plan.

DR. J. S. HINNERSHOTS.

THE PROJECT of a mammoth chrysanthemum show at the World's Fair early next month was considered by the Executive Committee of the Exposition last Friday and the vote was "No." Messrs. Craig and Smith then had a further conference with the Director General and other influential officials, as the result of which General Davis promised to have the matter reconsidered, but up to date nothing definite has been accomplished, and the chances of success seem rather slim.

BROOKLYN, N. Y.—Miss Marie Louise, daughter of Mr. James Dean, Bay Ridge, ex-president of the S. A. F., was married to Mr. Charles Willis Bouton, Tuesday evening, October 10, at the South Reformed Church.

### Carnation Notes.

In giving my views on carnations and the cultural methods I employ I do not wish to be understood as considering either my views or methods of culture as infallible. Although engaged in the culture of a divine flower I am only mortal and a very humble student of nature and her relation to the carnation. Mr. Shelmire has given us many good hints the past year, some of which may be repeated in these papers; if so it is well to remember that a good thing bears repetition.

The first thing for this latitude is to get your plants all housed as quickly as possible. My idea is to have them all housed by this same date in September. It is well to remember that more care should be used in the watering and syringing now than is necessary for earlier plantings. The days are shorter, the nights cooler and moisture does not evaporate as quickly as a month ago. Some varieties are more susceptible to injury from over-watering or having the foliage wet after night than others. Take Daybreak for an example, give it a little too much water at the roots or syringe it too late in the day for it to dry off before night and you will have the prettiest crop of spot you ever saw. Take Lizzie McGowan as an opposite, it can be syringed at all times and never show any apparent bad effects. Between these two lie a large variety, some more easily injured than others, and to make assurance doubly sure it is best to err on the right side and have all your foliage dry by sundown.

It may seem folly to say be careful not to plant your plants too deep, but you will occasionally find a careless employee who will put the plants in deeper than they were outside. This seems to induce a fungoid growth very similar to the cutting bench fungus, and the plants will die off at the ground. If you find any spot plants on your beds take the soil carefully as far around as you can and replace with fresh soil for replanting; it is well to do this even if you do not intend to replant.

For shading I either use a clay wash or tack up on the inside a cheap muslin. In using muslin get as coarse and loose a muslin as you can buy, for a tightly woven one will be more injury than benefit. The clay wash is put on the outside with a syringe and a good sized house can be covered in a few minutes. Any good clayey subsoil will do to make it,

and a few experiments will tell you what proportion to use. The wash will disappear with the first rain, and if it does not rain after the plants have taken hold, which is usually in about ten days, the hose can be turned on the roof and the shading washed off. The muslin can be taken down in about the same time, as the plants will want all the sun they can get after they have started growing.

Ventilation will be requiring some attention, as the ventilators can no longer be left open day and night without injury to the plants. In newly planted houses it is well to leave them open as the plants outdoors were used to cool nights, and will start better if the temperature is not changed too quickly on them. They are, however, very susceptible to wind blowing over them, and it is well to tack up muslin over the opening of the ventilators. I have found that the plants will do much better if this is done, and the ventilators left open day and night for about two weeks after planting, enough better to pay for the muslin in one season, and it is good for seven or eight seasons.

Remember that your plants do not have their full quota of roots yet and will not need any water until the soil actually begins to get dry. A good syringing about ten in the morning on all bright days will be beneficial and help to keep the spider away.

The greenfly will be making its appearance too if you do not begin operations at once to keep it out. There are numerous good preparations for their destruction, but I have found the best method is to begin about the first of October and smoke the houses with tobacco stems; if this is attended to regularly there will never be any fly in your houses.

A. M. HERR.

### Chester County Carnation Society.

The regular meeting was held October 7 at the society's room. A number of the members were absent, the fine weather being favorable to lifting plants and much of this work being yet undone. The plants still in the field were generally reported as having made very rapid growth during the past two or three weeks.

The subject of disposal of the gold medal offered at the Pittsburg meeting of the American Carnation Society was thoroughly discussed, the conditions under which the medal is to be offered being the point for determination. Some "Tight the restrictions should be the Broader as last year, viz.: "Best 6 blooms given a variety never offered for sale;" others you thought it should include those to be and As for sale in 1894, while still others Island of the including of all carnations. A final decision was deferred for one certainly

one read letters from two grow-

ers of new varieties of violets said to be proof against "spot."

C. J. Pennock gave notice of the annual chrysanthemum show of the Penna. Horticultural Society, to be held in Phila., November 7 to 11, and the request of Secretary Farson that a good exhibition be made by growers from this locality.

The subject of a Phila. flower exchange was discussed and hopes expressed that it might develop into a reality of benefit to growers.

Regrets were expressed at the cessation of "Seasonable Hints on Carnations" by our secretary, that have appeared during the past year in the AM. FLORIST.

C. P. Barnard reported violets planted indoors in July looking well and clear of "spot," while those from same lot left out of doors were severely affected. Old plants left indoors all summer were trimmed in closely and the new growth is strong and healthy. All were treated with Bordeaux mixture.

Messrs. Cope showed samples of their rose pots, a little wider across the bottom than the usual make with deeper rim.

Jos. Phillips spoke of using space under north bench of houses for growing stock geraniums from which cuttings could be taken during the winter. He had been very successful in propagating geraniums in August by shading a few days with paper and then exposing to full sun.

Mr. Jackson reported many carnation plants dead after moving indoors, having used dilute solution of ammonia, potash and soda as a fertilizer. The same not having injured tomato plants, some members were inclined to think there were other causes of the trouble. C. J.

Seasonable Hints.

The Queen of Autumn is again donning her best attire, so in a few days several of the early ones will be on the market. The same varieties vary in earliness in different localities, which is likely owing to the climatic differences. I received flowers of October Beauty mailed from Salem, Oregon, September 28th, which were so fully developed as to indicate that they could be had there in a marketable condition by the 20th, which is at least twenty days in advance of those generally cut in the eastern and middle states.

Houses with sash roofs that can be removed at planting time and replaced after the buds have set are very desirable for these early varieties. This affords abundance of air at all times, which encourages early bud formation.

I have also noticed that where early and late struck plants are set together the early ones are from five to ten days in advance of the late ones. This is worth considering, as a few days difference in date of marketing often makes the either profitable or unprofitable.

Of the varieties generally grown for an early bloom the following, in the order of their earliness, are the forward in this locality: M. Vauve, F. Bergmann, Merry Monarch, Beauty, Bolero, John H. Taylor, Summit, Mrs. M. W. Redfield, Altham.

Miss Kate Brown, Jessica and Harvest Queen.

John H. Taylor is the earliest large flowering variety I know of, being fully developed October 18, 1892, (and is equally early this season) seven and one half inches in diameter, with high built center, color white suffused with pink, much the same as seen in Mrs. Frank Thompson, and as it also resembles that variety in foliage I conclude it is one of its offspring, but as it not near as tall in growth it is very desirable when large early flowers are wanted.

Under the head of large flowering or exhibition varieties color is quite prominent with the following: The Cathedral, Mrs. Senator Hearst, Miss Minnie Wanamaker, Lillian Russell, Mrs. E. D. Adams and Vivian-Morel.

Of the incurved type, M. R. Bahuant, Mrs. Oliver Laughton, Mrs. Robert Craig, Guernsey Nugget, Mrs. Geo. Rundle, Irma and Mabel Simpkins, are the first in color.

In my last article "Esmeralda" should read *Ermenilda*. The former was sent out prior to Ada Spaulding and could hardly be a seedling of that variety. I probably wrote the name carelessly, hence the blunder on the part of the printer.

ELMER D. SMITH.

Adrian, Mich., October 10.

#### The World's Fair.

The canna beds are now very much the worse for the stormy weather, which has succeeded several sharp frosts. Most of the outdoor gardening now has a very autumnal appearance, excepting the pretty little mixed borders around the Massachusetts state building, which are as gay with bloom now as in the early summer. Among the plants flowering here are *Veronica baccata*, *Ceropegia lanceolata*, Chinese larkspur, asters, pansies, heliotrope and sunflowers. All the plants are kept trimmed and in good condition by removing the old flowers before they have time to go to seed, and to this we must credit the long blooming period of many of them. *Phlox subulata* was blooming freely here, in spite of its being one of our earliest spring flowers.

In front of the Pennsylvania building that fine bed of crotons is still looking very well, as brilliant in color as ever, in spite of cold weather. The only damage is the loss of a few leaves by the high winds. In and around the New York building Siebrecht & Wadley's big palms and other decorative plants are well disposed with good effect. The classical mosaic alcoves, on either side of the portico, where water from an artificial spring bubbles out and falls down over a flight of marble steps into a basin below, are encircled with *aspidistras*, *papyrus*, *aralias*, etc. The use of bay trees, palms, and *araucarias* around the building, and the small bay trees in the vases on the carpet of the roof, seem much in keeping with the character of the building, which should not admit the simple flowers that do so happily with the Old Colony building of Massachusetts.

In the large horticultural building there is nothing new to report; there is naturally a lack of flowers just now, though the fancy caladiums are arranged to relieve the monotony of the green. In the small greenhouses the tuberous begonias from New York are now very fine, and the roses are showing plenty of bloom. Chrysanthemums are coming on nicely in the department greenhouses, but are not yet in bloom.

Over on the island the Japan anemones are really very good; both pink and white are blooming very freely, and are most attractive. But there is little else in flower there now but what is past its best. That double purple datura is blooming more freely than it did earlier, but the plants are very ragged. The trees show a great lack of brilliant autumn tints, and the pretty little Island is rather forlorn in appearance these fall days.

#### Miscellaneous Seasonable Hints.

The labor and care of the chrysanthemums is not over yet, although we are close to their flowering time. Late varieties must still be disbudded, and don't be afraid to do it. I hear florist friends say occasionally "Oh, my customers won't pay those big prices for chrysanthemums." It is a mistake; if they only buy a few they want those fine flowers if their trade is worth anything. Don't let your "mum" houses be cold and damp, and don't expose them to a cold draft any more than you would a rose. In wet, cold weather a little fire heat is a great help with a moderate amount of ventilation. You can master the black aphid now because your houses have all been glazed and you can fumigate; but don't smoke too heavy at first; I believe it is a fact, and I think I have heard it observed by other men that plants, like animals, can endure tobacco if gradually accustomed to it. You have all observed that heliotrope is injured very much if a strong dose of tobacco smoke is given it, but I have proved that if you begin with a light dose and increase gradually heliotrope and many other plants will stand all the fumigation you can give them; and chrysanthemums are not injured in the least by tobacco smoke, either leaf or flower, unless overdone at first.

Don't forget to keep your ventilators well up in the carnation house. It is of the greatest importance that they have an abundance of ventilation day and night. With this treatment you may not get such a big yield of flowers for a month or so, but you will be repaid before the season is over tenfold. Even if the temperature goes down to the freezing point outside an inch or two of air is of great benefit just now. If you have a demand for carnation plants in the spring and have no plants to spare to lift from the field and winter in a cold frame, then put in a few hundred cuttings at once. They root well now, and if grown along during the winter, with one or two stoppings, can be grown into fine little plants in a 3 or 4-inch pot and will be quite satisfactory for summer. They will not flower as profusely at the start as the old plants, but before the season is over will be quite equal to them. These plants are not only good for the retail sales, but every florist who does a retail business should have a few hundred or thousand of this style of plant; he can then pick carnations during August and September when his plants in the houses are about used up, and the houses are being prepared for future stock. You can well afford to let these plants freeze up, for they have paid you well.

Don't let your gladioli bulbs freeze up. Dig them up some fine day, cut off the stem three or four inches from the bulb, and after the bulbs are dry store away in the coolest place you have above freezing.

Before you get all your tulips and narcissus planted don't fail to have some of them in pans. Pans are much better than pots and sell much better; 6, 7 and 8-inch

VALLOTA PURPUREA WITH 34 FLOWER SPIKES.

are the best sizes. An 8-inch pan 3 inches deep will hold one dozen Yellow Prince tulips and will sell well. Treat them just as you do the boxes of bulbs, but protect from frost a little more, as severe freezing may crack the pans. Chrysolora and Yellow Prince, La Reine and Vermilion Brilliant are all good for the purpose, and so is Von Sion narcissus. Wm. Scott. Buffalo, October 9.

#### Some Little Grown Greenhouse Flowering Plants.

Chorozeia; this is a pretty New Holland plant, and can easily be grown into a handsome specimen, as it stands pruning well. It does best in a cool house, and should not suffer for water, or it is apt to get spidery; it roots readily from cuttings. *C. cordatum* is a free growing kind with pea shaped flowers of orange and red. *C. varium* var. *Chandleri* is a fine dwarf growing variety with long branching shoots, and racemes of orange and red flowers.

*Habrothamnus elegans* is an old and useful conservatory plant, and will grow anywhere; it can be trained to a wall or pillar and is highly ornamental, flowering in dense racemes of reddish purple flowers, which are produced very freely.

*Kalosanthes coccinea*. This is one of the brightest colored flowering plants we have. It will grow under almost any conditions and should be pinched back during summer to encourage lateral growths, and should be kept rather dry during the winter. Its flowers are produced in umbels on the end of every shoot and are vivid scarlet in color. It is worthy of more extended cultivation. It is easily increased by cuttings.

*Luculia gratissima*. This fine hard wood plant does well in a camellia house, and it is one of the most deliciously fragrant flowers grown. While it will if planted out make a large bush it can be kept to almost any size by careful pruning. It also makes a good pot plant. The flowers are produced in terminal cymes, and are a beautiful pink and rather fleshy. It is propagated by cuttings of young wood about half ripened.

*Rogiera gratissima*. This is one of the finest cool house flowering plants in cultivation. In growth it somewhat resembles a laurestine. The flowers, produced in large terminal corymbs, are of a delicate pink color and are very fragrant. It flowers almost all the time, as the flowers are produced shortly after the growths are completed. It is a very free bloomer, and when young must have the trusses of flowers pinched out to encourage growth. It does well in a mixture of peat and loam with some sand added to it. It is propagated from cuttings placed in a frame with a little bottom heat.

The *aphelandras* are very bright and showy plants, and are useful for conservatory decoration in winter, but seem to be going out of cultivation now except on a few private places. They are easily propagated from cuttings of the half ripened wood. They should be grown in a warm house and should be pinched back to make good shaped plants. After flowering they must be kept cool and quite dry until starting into growth, when they should be pruned back to about three eyes of the old wood. *A. aurantiaca* is a good winter flowering species. The flowers are produced in erect terminal spikes and are of a deep orange scarlet color. *A. nitens* flowers in

the early summer, the flower spikes are four-angled, flowers very large and bright scarlet color. One of the finest species in cultivation. *A. Roezli* is considered the best and freest flowering one of the species, and being a winter flowering one is much more valuable. The flower spikes are large and bright orange scarlet.

*Echmea Mariae Reginae*. This is the handsomest bromeliad ever introduced. It is strong in habit, having large leaves twelve to eighteen inches in length, armed at the edges with sharp spines. The flower scape is erect and covered about half its length with large boat shaped bracts of a rich magenta shaded with rose, which remain a long time in perfection; the upper portion is thickly covered with flowers, which are tipped dark blue, changing with age to rose. It blooms during June and July. It is one of the most gorgeous and striking plants in cultivation, and never fails to attract attention.

*Tillandsia Lindenii* is a very handsome species of strong upright growth, leaves slightly recurved and fine pointed, upper surface light green and rose below streaked with brown. It bears a fine broad distichous scape, which is rose color, and the flowers are large, bright blue, with a white eye. This is the best of all the *tillandsias*.

*Burchellia capensis*, an old fashioned greenhouse plant, is a free flowerer and is very handsome; it makes a good shaped bush and is remarkable for the hardness of its wood. The flowers are in heads and are of a deep scarlet color, remaining in beauty for a long time.

*Dalechampia Roezliana rosea* is a fine shrub of branching habit. Like the *bougainvillea* its beauty is not in the flowers, but in the bracts, which are much larger than those of the *bougainvillea* and a great deal brighter in color, being of a rich carmine. It is also very free blooming. In habit it is erect and well branched. The flowers are freely produced from the axils of the leaves, the bright rose colored bracts situated at opposite pairs being heart shaped, very large and fragrant. To do it well it must be kept shaded from the sun. It is when well grown a beautiful thing, but is seldom seen now.

Madison, N. J.

Jas. S. TAPLIN.

#### Vallota Purpurea.

Often called the "Scarborough Lily." It is a native of the Cape of Good Hope and requires a long season of rest during the winter months. Its brilliant color and handsome form make it a universal favorite.

This plant is seldom seen in perfection with the gardener or florist or in any establishment where it is wintered in a greenhouse. But around the doors or piazzas, in the homes of the rich and poor alike, it is to be seen now (September) in all its glory. After blooming it is taken to the cellar, sheltered and rested until the coming spring. The *vallota* does not like to be disturbed much at the root. Once in three years is often enough, say about the first or second week in June.

D. A.

#### A Visit to Astoria.

"Take Dutch Kills cars and get off at Broadway." These are the directions given by W. H. Siebrecht when inviting you to come and see him. Dutch Kills and Astoria are both a part of Long Island City. Long Island City people evidently do not believe in pavements; certainly the dusty thoroughfares trav-

ersed by the bobtail contrivance called the Dutch Kills car are entirely innocent of such things; sidewalks are scarce, and the space between the car tracks has been dug out to the depth of a foot or more in places by the action of the horses' hoofs. Ask a Long Islander what is the cause of all this, and his invariable answer is "Pat Gleason."

The soil is apparently very fertile, for when one gets a momentary glimpse through the thick clouds of dust he sees on the right and left market gardens and farms all in fine shape and with abundant crops. As you get to the neighborhood of Broadway the surroundings improve considerably, and when you finally come in sight of a fine range of modern greenhouses surrounded by gardens brilliant with flowers and fields planted with carnations, lilacs and gladioluses—this is Willie Siebrecht's.

Once inside the houses we find that chrysanthemums are perfectly at home in Astoria soil. *Gloriosum*, Mrs. J. G. Whilldin, *Domination*, Miss Minnie Wanamaker and other popular varieties are in fine form. The two former Mr. Siebrecht calls his earliest yellows, the two latter his best early whites. Roballion is not an early variety with him and Golden Wedding he finds rather delicate and subject to mildew. He can do nothing with Mrs. Hardy, and President Hyde, which until last year was a standard variety with him, now runs very weak and will have to be discarded. He speaks very highly of Stonewall Jackson (sometimes called Crystal Wave) as a favorite late white.

Bulbs in variety and lilacs take possession of these houses after the chrysanthemums are done. Lily of the valley for the New York market is grown here the whole year round. Mr. Siebrecht says that cold storage valley is a very uncertain crop and its cultivation is attended with great risk and much loss. However, it takes but little room, and that is one consolation. His tulip bulbs after forcing, if fine varieties and especially those flowered after March 15, are not thrown away, but are planted outside for a year, after which time they are in condition to be forced again. These bulbs outside are not permitted to flower unless there is a good demand for the blooms, but the buds are picked off as soon as they show color. Allowing them to perfect their blooms outside or cutting off stem and foliage destroys the value of the bulbs for future forcing.

Carnations are and always have been favorite productions with the Astoria growers. Mr. Siebrecht has replaced six old houses the past season with fine modern structures, and four of these are to be devoted to carnations. He does not believe, as some growers appear to, that any old house is good enough for carnations, but that carnations deserve and will make proportionately as good returns if given good houses as roses will. Referring to the size of plants he asserts that some varieties, notably Tidal Wave, seem to do much better when small plants are used, and that large clumps are very apt to rot off and die.

A novelty recently imported by Mr. Siebrecht is *Asparagus Springeri*. This is a trailing plant, the sprays being from three to four feet long. The foliage is light green in color, hence is very different in form and general appearance from any of the species commonly known. The flowers are white, with orange tipped stamens. The fruit is in clusters, bright scarlet and very ornamental. It looks as though it would make a very fine

basket plant and the drooping sprays would be valuable in cut flower decorations. Mr. Siebrecht says that it is a strong grower and transplants well, and that plants from cuttings planted in the open ground in spring make fine clumps for potting in fall.

Not far from Mr. Siebrecht's, Mr. David Dean is located. Carnations are the main crop here; Tidal Wave, McGowan, Daybreak and Wilder all look as though in congenial surroundings, and there are 20,000 of them on the place. Mr. Dean says that Lamborn was his favorite white for years, but that it will not grow with him any longer and appears to have lost its constitution.

#### Points for Practical Men.

Everyone in business likes the company of practical men. One can not visit their establishments without picking up something new, as the successful man is never satisfied with the measure of his success, and is always alive to the possibilities of the future. Here are a few ideas that were rubbed off in a short personal encounter with Mr. John Burton, of Chestnut Hill, who belongs to the first division of the army practical.

In speaking of hot water under pressure Mr. Burton said that he had a small house 20x80 heated by this method some time ago, with excellent results. He had taken it out, however, on erecting a new range of houses, and connected the house to the steam boiler put in to heat the new plant. The boiler used to heat the water was made on the place out of thirty-five feet of 2-inch pipe in lengths about five feet long connected by return bends and arranged so that the pipes formed a long narrow coil, the water flowing continuously as through one pipe. The fire grate was 20x16 and the boiler was built in with fire brick, the top of the boiler was covered with a piece of iron laid on loose, the bricks were carried up a few courses and the space filled in with sand. It was always easy to get at the boiler to clean it, yet there was no gas. Connected with the boiler at the top was a 4-inch pipe seven feet high, with a safety valve on top and pipe leading out of the house; the height of water in this pipe gave the necessary pressure; 605 feet of 2-inch pipe connected with this boiler was sufficient to heat the house in the coldest weather, and Mr. Burton said he considered it heated the house perfectly and was very economical both in the matter of attendance and fuel. There was a short flue of about thirty feet. At the lowest point there was a small valve to draw off the water.

Several houses are planted with carnations that have been growing on the benches all summer; they have made a good growth and look well. Said Mr. Burton: "We expect to get a heavy crop from these plants before February, as we will take them out to make room for young roses about that time."

"What roses are you forcing this season?"

"Well, I am strong on Meteor; it paid me next to the Beauty last season, and much better than any of the other teas. My man said it was the best selling rose he carried. It requires about 5° more of heat than the others, and does best with a house to itself. It does well up to July. I have a lot of Beauties and Belles, and expect to have some fine flowers of the Belle this season. Last year I had to cut the stock up so for cuttings that it did not have a chance to show what could be

done with it. I grow also Brides, Mermetts, Cusins, Wattevelles, Hostes.

"In hybrids I confine myself to three varieties, Laings, Brunners and Rothschilds. Forcing early hybrids is a lottery; with apparently the same treatment a success of one season will often prove a complete failure the next."

"You have been very successful with *Asparagus plumosus*; does it not pay better than smilax?"

"Yes, I think it is a better crop; it has taken the place of smilax for many purposes. I have no trouble to sell all the strings I can cut, as well as the branches or fern-like leaves that come up from the bottom, which are much used."

"What do you do with the hops; are they good for manure?"

"No, I use them to lighten up my palm soil a little."

"Is there as much demand for large palms as ever?"

"Yes, I can't get them large enough fast enough, I have a few here that measure twelve feet high and about eight feet in diameter through the bushy part of the plant; they have been sold for \$60 each and will be sent away before long." These were certainly extra choice plants, and outside of this home of fine arecas we question if they could be duplicated.

"Do the insects ever get ahead of you?"

"Once in a while we find a plant where they are pretty bad, then we apply whale oil soap with a little friction, and it generally fixes them. Fresh tobacco water syringed with some force is a good preventive."

"The areca and kentia are my best palms. The kentias are coming into favor, for although they are the most expensive, yet they are so useful in decorations and as house plants that they are worth the difference. It is not generally known that while kentias will stand a lot of knocking about and neglect without apparently showing the effects of it, they are very susceptible to the slightest frost, and are not as hardy in this respect as are arecas."

"*Rhapis flabelliformis* I find to be in demand, and I think it a better variety than *humilis*, which is thought well of by some."

"You have a nice lot of orchids."

"Yes, I hang them up to the rafters in all my palm houses, where they take care of themselves. They bear quite a lot of flowers during the season."

"What are you doing to your boilers?"

"Taking this pair out; they are cast iron sectional boilers, for which I am substituting a regular return flue tubular. I believe it is the best. It is the kind of boiler that nearly all manufacturers use, and they have tried almost every conceivable kind of boiler for making steam; have spent thousands of dollars where the florists have spent one, and have come back to this type of boiler. It is now adopted as the standard for large manufacturing plants everywhere."

K.

#### Judging at the Toronto Show.

ED. AM. FLORIST:—With your permission I would like to answer E.'s criticism on the judging of the Toronto show for the credit of my colleagues, my own shell being too hard for any such darts to pierce.

First I must thank E. for his sympathy, but must at the same time assure him it is entirely unnecessary. E. seems to forget that there was such a thing as a schedule, by which, in a measure, every judge is bound. How often is the question asked in cases of close competition,

"how does the schedule read?" or what is the wording of it, the present being a case for just such a question. We had three distinct types of tables to judge, viz., what E. styles the old stereotyped pyramid, not so compact or clipped as of yore, next one of the most artistic pieces of nature I think I ever saw, and thirdly a hybrid between the two, and I should say evidently a first cross, with the usual result of a first attempt at improving nature. Every father thinks his own child the best, and I think rightly so, and as E. stood somewhat in the relation of parent to the hybrid I am not at all surprised that he should think it should have been placed at least.

The schedule called for the best display of plants on table, and as such they were judged. And here let me say that each man went through the exhibits entirely alone, and when notes were compared we were a unit in our awards. Now, as regards my asking for assistance, I did not even know there was any intention on the part of the directors to give me assistance until so informed by the secretary, and when I saw the exhibits I must certainly say I was glad instead of sorry, although I want to tell E. that my opinion of the one judge system has not altered since I first advocated it some years since. If anything the present case has somewhat strengthened it.

Now with regard to Friend Houston, critic number two, I think he hardly realizes the very severe criticism of his own work his article implies, for a more deliberate murder of certainly the choicest and best grown plants in the hall could hardly be performed, many of the choicest gems being literally buried, while as for arrangement there was none.

I think perhaps good will come out of this tangle, as I think from conversation with some of the directors they will upon representation make at least two alterations, one in the wording of the schedule, and also two classes, one open and one for the trade, which I venture to say will be acceptable to the exhibitors in general.

F. G. FOSTER.

#### New Rose "American Perfection."

We have received flowers of this rose from Messrs. Nanz & Neuner, Louisville, Ky., with whom it originated. They inform us it is a sport from Mme. Pierre Guillot, but it is strikingly dissimilar. The flowers are large, rather round, borne on very stiff stout stems, foliage like a *Mermet*. The color is much like a *Mermet*, but the inside of the outer petals appears streaked and stained with light carmine. Something in the texture of the flowers suggests Mme. Labarthe. The flowers have a good tea fragrance. Messrs. Nanz & Neuner write us that the chief point they admire in this rose is its great vigor and strength of bloom, and also its lasting qualities; it stands uncut for so long after being fully expanded without decay. It also proved very satisfactory during dull winter weather. It is certainly very attractive in appearance.

#### New Southern Roses.

A climbing *Malmaison* has originated as a sport with Mr. R. N. Little of New Orleans, who is an enthusiastic rose grower. The climbing character seems very persistent, while the bloom is a perfect reproduction of the type. Mr. Little has also produced a fine climbing *Noisette*, which he has named Prof. T. G. Richardson. A number of seedling teas of Mr.

Little's are now under trial, and will be sent out at an early date. Among them is Winnie Davis, a seedling from Mme. de Watteville, which has received a great deal of praise. It is thought that this variety will be excellent for forcing.

New Orleans.

H. P.

#### Greenhouse Bench.

The accompanying sketch shows a section of a cheap and durable bench used by Mr. W. N. Rudd, of Mount Greenwood, Ill. The parts consist of uprights of  $\frac{3}{4}$ -inch pipe, a  $1\frac{1}{4}$ -inch iron washer with a  $\frac{1}{2}$ -inch hole in center, a 6-inch piece of  $\frac{3}{8}$ -inch pipe, and cross-pieces of 2-inch plank 6 inches wide. The cross-pieces have  $\frac{1}{2}$ -inch holes, 3 inches deep, bored in the lower edge near the ends.

In putting up the bench holes 14 inches deep are dug with a post-hole auger and a hard-burned brick placed in the bottom of each. Then beginning at one end the two holes are filled with cement, the uprights placed in position resting on the brick, the washer placed on top of the end of the pipe, the piece of  $\frac{3}{8}$ -inch pipe driven into the wooden cross-piece and the latter set on to the uprights. This being secured to the side of the house to keep it in position until the cement sets. Then the next pair of holes is filled in the same way and the cross-piece that covers it attached to the preceding one by a couple of laths tacked on criss-cross to brace it steady, and so on down the house.

Mr. Rudd puts the cross-pieces on 3 feet apart and believes this is much the most economical in the end, as the boards in the bottom of the bench last much longer when the supports are close together, and in these benches 6-foot stuff can be used for bottoms and it is much cheaper than longer boards. All the wood being treated with crude oil he finds that a bench of this construction lasts as long as he needs it and the cost is comparatively slight.

#### Boston.

The annual fruit and vegetable show of the Massachusetts Horticultural Society took place on October 4 and 5. Both halls were well filled with the display, which was exceedingly good throughout, and attracted more than the usual number of visitors. An interesting and novel feature was a device for evaporating fruit, exhibited by the American Manufacturing Co. of Waynesboro, Pa.

Hothouse grapes were excellent. Geo. A. Nickerson showed ten varieties, of which Buckland's Sweetwater, Annick Seedling and Gros Maroc were among the best. Mrs. J. W. Clark's Black Hamburg and Alicante were also very fine, the largest bunch of the latter weighing eight pounds, four ounces.

There were but few flowers in the hall, except the beautiful stage decoration of flowers and foliage arranged by James Comley, some good phloxes and pansies from L. W. Goodell and J. Warren Clark's collection of superb gladioluses, which was awarded a well deserved silver medal.

The customary lunch was provided for the committees and a few invited guests at the Tremont House. The fruit men were seemingly in a very happy frame of mind, which could not be on account of the abundance of the grape and Bartlett pear crop, for both grapes and pears have been so cheap as to be scarcely worth marketing; neither could it be the high price of Baldwin apples, for the price is no comfort when one has none to sell. It must have been simply because it is the normal condition of any man whose life is devoted to the pursuit of any kind of horticulture to be happy regardless of circumstances or surroundings.

Prof. Maynard brought a large delegation of students from the Amherst Agricultural College to see the exhibition. Mr. E. H. Krelage of Haarlem, Holland, was a welcome visitor.

The meeting of the Gardeners' and Florists' Club on Tuesday, October 3, was, like all the meetings of the past summer, very poorly attended. This fact furnished a topic for discussion and insured a very interesting session. Various reasons for the disinclination on the part of members to attend the meetings were advanced by the various speakers. Mr. P. Welch summed up the matter in this wise: "They do not like to get away from their premises on these hot nights." This effort on the part of Mr. Welch met with the customary success in bringing down the house, and the two members who had been asleep opened their eyes, blinked and looked around to find out what it was all about. The subject of the annual supper came up and it was voted that it should take place about the time of the chrysanthemum exhibition instead of midwinter, as heretofore, it being likely that more visitors would be in town at that time whose presence would add much to the occasion.

The cutflower prices remain about as quoted one week ago, but it cannot be said that there is any great activity as yet. Roses have shortened up somewhat in quantity, so there is no overstock. Carnations continue high in price and good blooms of standard varieties bring on the average \$2 per hundred, and select Daybreaks and Buttercups and such special kinds have been selling for the past week as high as \$4 per hundred for extra blooms. There are still a few asters, but there is little demand for them, as the quality is poor. Violets are to be had at from 50 cents to \$1 per hundred for Marie Louise. A quantity of single violets are being sent here from Philadelphia, but these have never been popular with the Boston trade and the sale is very limited even at the low price at which they are offered.

There are very few chrysanthemums seen in this market as yet; Wm. Edgar and Thomas Cox are both cutting *Mlle. Lacroix*, which is the earliest white in this section. Wm. Edgar has one house filled with this variety which is already a sheet of white. The next white which he will cut will be *Ivory*, and Pres. Hyde, his earliest yellow, is just at the same stage. Mr. Edgar has a seedling which he describes as a yellow *Ivory*, which was very satisfactory last year. It has not been named yet and it is understood that a certain Boston retail florist is to have the privilege of christening it, on

which occasion he is expected to follow the illustrious example set by one or two gentlemen under like circumstances last year. Another "pansy punch" is among the possibilities.

The city of Boston has finally secured two lots of land at East Chester Park of about two acres each, which will be used for greenhouses and storage purposes for the park department. One of the lots is well adapted for the location of a fine range of modern greenhouses.

N. F. McCarthy & Co. sold at auction on Saturday, October 7, a fine lot of plants for Pitcher & Manda and several local growers. The prices of novelties and fancy stock were low, but good commercial stock, such as palms of moderate size, pandanus, rubbers and such standard sorts, brought prices fully up to wholesale rates. There is plenty of room in this market for a good quantity of salable stock in this class of plants.

The annual election of officers and standing committees for the Massachusetts Horticultural Society occurred on October 7. The regular ticket was elected without any opposition and the officers are practically the same as they were last year.

Houghton & Clark, formerly employes of Norton Bros., have opened a store at 443 Boylston street.

Strangers in town this week: E. H. Krelage, Holland; A. T. Bodington, Short Hills; and J. A. Penman of New York.

#### New York.

The monthly meeting of the Florists' Club on Monday, October 9, was well attended, about sixty members being present.

The principal subject discussed was the coming chrysanthemum show. Mr. Bergmann reported for the show committee that applications for space are coming in rapidly. Manager McCrowe told of a proposed illustrated catalogue to be issued and showed samples of lithographs which it is proposed to circulate. Arrangements for the appointment of judges and other officials were perfected.

Mr. James Dean made a statement regarding medals won by New York state in the horticultural department of the World's Fair, and said it was probable that the club would be able to obtain some of these medals in recognition of the service it had rendered the state exhibit in this department. He proposed that the club should send a quantity of flowers for use on Manhattan day at the Fair, which occurs October 21. This was agreed to amid much applause, and a large number of members volunteered to contribute. All desiring to send flowers for the occasion can ascertain time of train leaving and all particulars by addressing Secretary Young.

Two new members were admitted.

Mr. C. W. Ward showed some fine blooms of Dorner's seedling carnations.

L. Forsterman, of Newtown, L. I., is the first grower in the market with chrysanthemums in any quantity. His earliest yellow is a seedling of his own, named Yellow Queen. Close following upon its heels is Kate Brown, also yellow. October Beauty and Mrs. J. G. Whilldin, of course, are two of the very earliest, and Girard and Wanamaker are not far behind.

There are few places in the neighborhood of New York looking any more thrifty than Forsterman's. Many of the houses are made to do double duty. The benches are filled with palms, ferns, selaginellas and other plants which like a little shade, and overhead cattleyas, vandas

and dendrobies are suspended by thousands. Cattleya labiata and C. Gaskelliana are in bloom now. The latter is a special favorite with Mr. Forsterman, as it can be easily brought into bloom at almost any time it is required. Every foot of room in all the houses is utilized for carnations, genistas, azaleas, araucarias, etc., and the frames outside are filled with pansies, lilies, tulips and promiscuous bulb stock. If any grower wishes to learn a profitable lesson in the utilization of space to advantage he should pay Mr. Forsterman a visit.

Louis Dupuy, Whitestone, brings to the market a magnificent white bouvardia, which ought to be grown extensively here, B. Humboldtii. In Paris Mr. Dupuy says it is the only bouvardia considered worth growing. The blooms are as large as those of a jessamine and are very fragrant. It blooms from September until December. Easily propagated from soft wood cuttings.

The daily papers have been complaining of parties who have been swindling the public, in the vicinity of Fulton street, by offering for sale highly perfumed bunches of grass, which they called "California coral," and which they "warranted" to grow in water and get sweeter as they grow older, but which proved to be a common sea weed scented up for the occasion.

The *Mail and Express* says that "the shops of the florists, in the expensiveness of their fixtures and the gorgeousness of their attractions, are beginning to rival some of our most famous bar rooms." The writer is still at large.

Ernst Asmus is trying the experiment of holding over a few benches of Meteor for a second year. They appear to be doing well with the exception of one house which suffered from being dried off too severely.

Paul Dailledouze says that there is more money in Silver Spray than in any other carnation grown.

Chris Butler is satisfied with his move from Summit to Bayside, and says he has struck just the right soil for roses. He has built another 150 foot house this year.

Thos. H. Spaulding is going to build a handsome palm house 56x36. Thos. W. Weather's Sons have the contract.

"Bennie" Eckiel has opened a flower store at 933 Broadway.

Geo. H. Linsdale, of 23rd street, is celebrating the birth of a daughter.

J. H. Troy, of Short Hills, sailed for England on October 7.

H. A. Daacke, the seedsman and bulb dealer, died October 4, of inflammation of the lungs. Mr. Daacke was born in Germany in 1852 and came to America in 1869. He was for many years with F. E. McAllister, starting in business for himself in 1891. He leaves a widow and three children. The funeral was held October 8 from his residence in Hoboken.

#### Chicago.

Business is improving, but the quality of the flowers in most lines leaves much to be desired. Roses and carnations do not seem to improve very rapidly. Perles are fair, and there are some good Beauties for the season. Brides and Mermets frequently show traces of mildew. Carnations are rather better, but a good many poor flowers are sent in. Double violets have made their appearance and bring \$2; the demand for them is very good. The only chrysanthemums in are inferior whites grown in sprays, without any disbudbing; they are very poor, and

a detriment to the reputation of the flower, one would imagine. Cosmos is in though not in great quantities; it is not extra good, having suffered severely from dry weather. Tuberoses are much better than they were, both in size and color. Dahlias are rarely seen, and the amount of outdoor material is very scanty. Smilax is generally scarce.

Visited Chicago: C. A. Rieman, Connersville, Ind.; Samuel Henshaw and wife, West New Brighton, N. Y.; F. G. Foster, Hamilton, Ont.; J. Horace McFarland, Harrisburg, Pa.; R. G. Ran, St. Joseph, Mo.; Chas. Loveridge, Peoria, Ill.; Wm. Sharpe, Kansas City, Mo.; Andrew Washburn, Bloomington, Ill.; N. Admiral, Danville, Ill.; John Evans, Richmond, Ind.; H. B. Beatty, Oil City, Pa.; Mr. and Mrs. Jas. Hancock, Grand Haven, Mich.

#### Philadelphia.

The October meeting of the Florists' Club was well attended and very interesting. It was the night for the election of officers to serve for the ensuing year, and as there had been but one person nominated for each office the secretary cast the ballots for the various candidates. The officers are: President, Edwin Lonsdale; Vice-President, H. C. Scheafer; Secretary, H. F. Michell; Treasurer, Thos. Cartledge. Each of the gentlemen was called on for a speech and responded in a few well chosen words. The names of two gentlemen were added to the club roll.

Several questions from the box were given out, one about the prospects of the carnation for the coming season, was answered by Mr. Herr, who thought from present appearances the dealers would get all the stock they wanted, and perhaps more, and that the quality would be all right. One in reference to a flower market for Phila., referred to John Burton, was turned down by that individual as being too much of a chestnut. We presume that this must be the reason that the question is agitated every fall.

Who will be first in the race with chrysanthemums is the question that is agitating the minds of the growers. At this writing, October 7, none have as yet made their appearance, but it is only a question of a few days. Mrs. Whilldin seems to be the most forward, and is likely to be the first variety ready to cut.

Things are getting livelier and the dealers are more disposed to stock up. All kinds of flowers are looking better. Roses are improving both in size and color, and for the finer varieties the price is a shade higher, La France, Mermets, Brides being \$3 to \$4 a hundred; Cusins, Wattervilles, Perles, etc., 2 to 3; Kaiserins and Meteors 6; Beauties and Belles \$1 to \$2 a dozen. Carnations are also fast getting into form and some good flowers have been seen the past week; the best sell for \$1 per hundred.

There have been no killing frosts as yet and the outside flowers are now very fine. Dahlias are at their best and quite a number of them are being sold; the price is \$1 per hundred. Pyrethrum is also fine and sells well in bunches of about a hundred flowers for 15 cents. Tuberoses are very abundant at 2½ to 3. The first good cosmos arrived on the 7th and brought 50 cents a hundred. Valley is plenty at 4, smilax moves slowly at 15, asparagus 60 to 75, adiantum \$1.

Myers & Santman, of Chestnut Hill, have a seedling carnation of which we think they have good reason to be proud. It is a pink, some few shades darker than

Daybreak, in fact it might be said to be half way between this fine variety and Grace Wilder in color, but having the habit and strength of Daybreak, which we believe is one of its parents. It is fully as large a flower as Daybreak, and is in our estimation the best pink carnation we have ever seen.

Pennock Bros. have out a new wagon which is a stunner, being half as large again as their old one; a new horse is also added to the stock, and we presume that the next in order will be new business.

H. H. Battles has also been obliged on account of his increasing business to add a horse and wagon; this is Mr. Battles' first attempt in this line, and we believe it is to be a stunning rig.

The Craig bowlers are getting into great shape and have defeated their opponents in the last two matches. In the last contest George Craig and John Westcott, of his side, both put up over 500 in three games, which is very good work indeed.

Secretary Farson is improving slowly, but must do a little better if he expects to be in shape for work at exhibition time; he is still confined to the house. K.

#### St. Louis.

Trade for the past week has been fair, and continually shows signs of improvement. The expected increase in demand owing to the Veiled Prophets' Ball was fully sustained, and while prices averaged no higher, stock was pretty well cleaned up.

The decorations at the ball were a decided contrast to what has been used heretofore. The large fountain in the center of the hall instead of being banked with palms and foliage plants as formerly was covered with fine wire netting, making it like a circular tent; inside this were placed numbers of colored electric lights, and upon the netting various designs and figures were worked, symbolical of the Veiled Prophet organization. The base of the fountain was banked with palms. Taken as a whole the effect was novel and was variously commented upon; the flowers used were mostly outdoor stuff consisting of dahlias, cannas, gladiolus, lilies, etc.

The orchestra was placed on a raised platform and screened with *Asparagus plumosus*, with bunches of lilies at intervals. The staircases and walls were decorated with flags. Suspended from the balcony, which overlooks the hall on all sides, were baskets of plants and canary birds in cages alternately. This latter feature might be done away with altogether, as the birds never utter a note and the baskets are too high to have any effect. Flowers were used by the majority attending, mostly carried, although many were worn.

At the last meeting of the Bowling Club an assessment of \$1 per member was levied, and the boys were so jubilant over the promise of cooler weather that several heavy averages were made, the best being by Geo. Ostertag, who in four games had 212, 213, 186 and 201 to his credit, giving an average of 203. Next came John Young with an average of 183, closely followed by J. Beneke and C. Beyer, with 181 and 175 respectively. The bowling all through was good.

The Michel Plant & Bulb Co. have issued a circular notifying the trade that on October 10 they will offer at auction their stock of palms, as well as quantities of ferns, aspidistra, grevilleas, hydrangeas, etc. The move is a novelty in this

section and the result will be watched with interest.

Wm. Huckey, who has built this season in Belleville, Illinois, has his houses planted with carnations and roses. He has already commenced to cut carnations, and his roses are looking well; they consist of Brides and Bridesmaids. His houses are piped upon an entirely new system and the outcome is being watched with considerable interest by those in the trade. R. F. T.

#### Buffalo.

Business has been quite good for this time and flowers are plentiful. Carnations are the most scarce. Our commission man is receiving a fine assortment of flowers daily and we all depend on him in case of an extra call. There was never so fine a lot of roses seen in this city at this time of year as there is at the present season. A call at the store of W. J. Palmer & Son this day let the writer see a magnificent lot of roses of their own growth and of a quality away above proof: Testout, Beauties, Mermets, Brides, Meteors, and all were good, but the finest of all were the La France. D. B. Long is so confoundedly busy with his bulb business that he has no time to be civil to his customers. He hopes to get through with his bulbs this week so he can take one more (about the 5th) trip to Chicago. W. A. Adams, better known as "Andy," of the firm of Adams & Nolan is in Chicago. Next week will see several more on the road for the white city.

Weddings are coming off as they should at this season of the year. One of the most noticeable of them this week was on Franklin street, where orchids figured largely. The ceremony took place under a canopy of asparagus, from which was suspended a handsome basket of orchids. A mantel was also finely decorated with orchids and Farleyense fern. This order was given entirely because the bride had seen orchids used at some other party, at which she attended, so it seems there will come a time when orchids will bring their value.

An amusing incident of the week has been the visit of Mr. Burt Eddy and Mr. Lloyd Vaughan of Chicago. B. E. is certainly the comedian of our national society and the wrinkles of his face are marvelous.

The oldest son of Wm. Scott was married last Thursday. The ceremony was very quietly performed, but on Saturday at the house of the bridegroom's father, a ratification meeting was held. All previous actions were endorsed and the ten score of folks present, young and old, went away saying they had had a good time. Mr. Eddy added largely to the enjoyment of most of the elderly matrons.

A very popular stevedore died last week and the funeral called for a large lot of flowers. J. H. Rehstock got the bulk of the order and had so much of it that he had to call on his neighbors to help him out, which they cheerfully did. W. S.

#### Baltimore.

The Cactus Club's exhibition was altogether a most creditable affair. It effectually did away with the idea that no exhibition of plants can prove a success here unless in bloom, for besides being crowded with visitors daily it was brilliantly successful financially.

The hall was, unfortunately, much too small, giving only about one half enough

space for either exhibits or visitors, but to an onlooker from the main entrance presented quite a pretty though crowded appearance. A group of tall plants (palms, etc.), in the center concealed the musicians, and a bank across the end of the hall afforded a pleasing background. Just in front of the central group was a masterpiece of mosaic bedding, a circle about fifteen feet in diameter, worked out in an intricate pattern of echeverias and cacti, with lines of crimson, yellow and red alternanthera running through it. It was designed and executed by Mr. Chas. Seybold.

Walking around among the groups of visitors one could not help being struck by the familiarity with which many described the habits and flowers of occasional specimens to others and even named them. To be sure the names were not according to any botanical treatise, but they sufficed, and it may be questioned whether a great deal of the popularity and success of the show was not due to the fact that every amateur flower grower could find his or her rat tail, fish hook, snake, turkshead, prickly pear or old man cactus somewhere in the display, or something that was nearly enough like them to pass for them. Popular names are great helpers to spread the love of flowers, and it is to be hoped that, with all the possible confusion that may result, they will increase and multiply till every flower has a common everyday title, as well as a technical and, too frequently, jaw breaking one.

There were numerous good things in the cactus line at the show, especially among the mammillarias; possibly the very prettiest thing in the entire lot was a plant of *M. lasiacanthus*, which, with its tuft of spines on each projection seemed covered with pearly white blossoms. There was a plant of *Cereus giganteus* six feet high and eighteen inches in diameter; another of *C. colubrinus* twelve feet, and several great trees of *enphorbias*.

A glass case contained a choice collection sent on for exhibition by a German firm, among which were *Mammillaria cirrhifera*, *M. micromeris*, *M. radiosa*, *M. picturata*, *M. Schellhases sericata*, *M. applanata*, *M. longinamma*. They were all quite small, but perfect in every way and to a close observer very beautiful. This was the only collection on exhibition that was named, all the other plants being numbered and staged for effect. The members of the club were unwilling, as the exhibition was not competitive, to say which plants belonged to any one. No premiums were offered of any kind, and the show was unique in this as well as in many other ways. It is popularly supposed here that we have the only Cactus Club in America and have given the first exhibition exclusively of cacti.

MACK.

#### Washington.

October opened with a rush in the florists' line, largely owing to several so-called fall and removal openings of some of our larger dry goods stores. Otherwise trade of late has been very quiet, and mainly confined to funerals and weddings. Society is altogether dormant as yet, and balls, parties and the like are not even talked of. Florists, in common with other lines of business, have suffered severely from the prevailing depression. On being asked "How is business?" a florist the other day remarked, "Oh! we are doing fairly well for the season, but cannot make collections."

During the past summer the Gude

Brothers sold their entire original plant on the south side of the Good Hope Road to Lacy & Kramer, the latter formerly with Studer, and the first named head man at one time with the Gudes. The Gude Brothers at once erected a new establishment nearly opposite to their former place, which, when finished is to exceed in dimensions their old one.

Strauss has opened a branch of his Masonic Temple salesroom in one of the fine stores fronting on Thomas Circle, 14th street. And Studer, I learn, has leased what he is pleased to call a "chrysanthemum farm" in the vicinity of Alexandria, Va. H.

Toronto.

Trade has perhaps been a little better all round this week, and it is to be hoped that the dull time is about over and that business may keep on improving as the winter approaches, but there have only been a few very slight frosts as yet.

The parks and gardens and suburban walks are looking very pretty now with their autumn tints. The mountain ash is very heavily berried this year.

The chrysanthemum show has been postponed to November 21-24. This is perhaps a little late, but owing to Thanksgiving Day falling on the 23d this year it was thought better to take the week that would include that day. It is perhaps a week later than a chrysanthemum show ought to be, but it should not be difficult to retard the plants and flowers in order to have them in perfection at that time; in fact it is often difficult to get the best flowers out by the first week in November. Thanksgiving Day being a general holiday all over the Dominion, a good crowd may always be reckoned on as certain, and this fact of course went a long way towards inducing the committee to change the date.

E.

## New Notes.

LOGAN, O.—H. Gompf has added three new greenhouses.

NEW ALBANY, IND.—A lilac bush was in full bloom here during September.

GRAFTON, MASS.—Frank Fisher has just completed a two hundred foot house.

CHESHIRE, CONN.—J. Walter has removed his greenhouses and business to this place.

NORTHAMPTON, MASS.—Chas. H. Brewster died suddenly from heart disease, October 7.

MERIDEN, CONN.—Wm. Woodley has recently completed a range of four fine greenhouses.

RANDOLPH, MASS.—B. L. Clark has added another large greenhouse to his establishment.

EVANSVILLE, IND.—Theo. D. Kuebbe is building three new greenhouses and has opened an office in this city.

WAPPINGERS FALLS, N. Y.—Mr. I. T. N. Harcourt has completed his new greenhouse. It is fitted with all modern improvements.

PITTSBURG, PA.—The Pittsburg and Allegheny Florists' and Gardeners' Club has decided not to give a chrysanthemum show this season.

SHARON, MASS.—An incendiary fire was started in the potting shed of A. N.

Davenport's greenhouses early in the morning of October 2, and about thirty feet of the greenhouse was consumed. Loss \$1,000.

PITTSFIELD, MASS.—The schedule for the chrysanthemum show of the Gardeners' and Florists' Club of Berkshire county has been issued. The exhibition will be held at the Coliseum, Pittsfield, on October 31-November 1, 2, 3.

MORRISTOWN, N. J.—The greenhouses and barns belonging to Thos. G. Holton were destroyed by fire on the night of October 3. All the plants and two horses were included in the loss, which was estimated at \$10,000. The fire is supposed to have been incendiary.

PROVIDENCE, R. I.—The Rhode Island Horticultural Society will hold its annual chrysanthemum exhibition in Music Hall November 8, 9 and 10. From various sources come reports from exhibitors that their display this year will eclipse all former efforts. A large premium is offered for collections and silver cups for cut flowers.

CINCINNATI.—Trade seems very unsettled and our retail stores are still complaining on this account. Roses, carnations, and lily of the valley are now coming in much better, both in quality and quantity. Chrysanthemums will make their appearance in this market on Monday, October 9, and during the season will turn out some very choice flowers.

MINNEAPOLIS, MINN.—A party variously known as H. J. Smith, H. Smith and J. H. Smith, recently in the employ of R. J. Mendenhall, succeeded in borrowing various sums of money from his fellow employees and then left for parts unknown. Smith was a good workman but unprincipled. He boasted of having visited nearly every country on the globe and was a glib talker; could speak four or five languages, was polite and made a good impression. The trade should be on the lookout for him and see that he is unable to repeat the tricks he played in this city.

CLEVELAND, O.—Mr. J. C. Gooding is again in charge of the Gordon rose houses, which are now in the hands of a grandson of the late W. J. Gordon. Mr. Gooding took charge four months ago and since then six splendid new houses have been added to the establishment. Four of these are 20x100 and the other two are 20x150. This makes thirteen houses in all. Three of the houses will be planted with violets and two with carnations; the rest, as usual, are in roses. All the stock is in excellent condition and will undoubtedly yield the returns for which Mr. Gooding is noted. A visit to this place will be worth the while of any grower.

## SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

**SITUATION WANTED.**—By a gardener and florist; Single. First-class references. Address 111 care Baumgartner, 111 Strig St., Chicago.

**SITUATION WANTED.**—By German, 25 years of age, as assistant; good greenhouse man; single. Address E. N. P. O. Box 64, Bedford, N. Y.

**SITUATION WANTED.**—A French gardener, of great experience, employed at the Fair wishes a situation; gentleman's place preferred. Can give the best references. Address A. Z., care Am. Florist.

**SITUATION WANTED.**—As foreman in commercial place. Have had 10 years' experience in growing of roses, carnations, violets, etc., and can furnish good references. Address D. P., 3000 Wentworth Ave., Chicago.

**SITUATION WANTED.**—As traveling salesman for seeds, plants, bulbs, etc. Am at present holding a like position; will be disengaged November 1st. State salary. Address SALESMAN, care F. Stevens, Claymont, Delaware.

**SITUATION WANTED.**—As foreman or manager in a commercial place of 25,000 or 30,000 feet of glass. Specialist in growing American Beauties, La France, and other varieties; also carnations and violets. First class place wanted. Best of references. State wages and particulars. Address P. Y., care Am. Florist.

**SITUATION WANTED.**—By a young Hollander, speaks English, wants to change from present situation; 12 years' experience in bulb growing and forcing; understands the seed and greenhouse business. Understands thoroughly the French and German languages. Good references. G. L. W., care Am. Florist.

**WANTED.**—A first-class maker-up and salesman at once; permanent place to right party. Address J. J. M., care American Florist, Chicago.

**WANTED.**—A general florist, one who can grow roses, carnations, and general plants; also make up floral work. N. ADMIRAL, Danville, Ill.

**WANTED.**—In private place, a capable single man, of good habits; experienced in care of orchids, as well as a general collection of plants. Must milk and care for one cow, attend two fires and be generally useful. Address, with full particulars, AMATEUR, care American Florist.

**FOR SALE.**—One complete set (4 volumes) of Nicholson's Dictionary of Gardening—never used; cost \$24.00. How much for them. Address A. E. D. GRUETTER, 345 N. Clark, Chicago.

**FOR SALE CHEAP.**—The very handsome oak finished and plate glass ice box, shown in our exhibit at the World's Fair. Visiting florists to need of a fine box will please examine this. VAUGHAN'S SEED STORE, Chicago.

## FOR SALE OR RENT.

Rose and cut flower growing plant containing about 35,000 square feet of glass, together with all the plants, pots, snail, tools, etc. Everything in running order; good trade in town of 8,000 inhabitants. Good reason for selling. Any one wishing to start in business, here is a paying place. Address Lock Box 494, Webster, Mass.

FLORIST, care Chas. E. Prather, Louisville, Ky.

## FOR SALE.

## The Seed Trade.

## AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

VISITED CHICAGO: H. de Vilморin, W. J. Langbridge, R. Engelmann of the Nebraska Seed Co.

RECENT LETTERS from Europe confirm the worst anticipations as to next year's crop of beet, carrot and other root seeds.

H. A. DAACKE, of New York City, a well known dealer in bulbs and florists' supplies, died October 4th of inflammation of the lungs.

THE CONDITION of the onion seed market is difficult to fix just now, but in a general way holders seem disposed to make a rate of from 20 to 25 per cent below last season's prices to make a start. Whites, Strasburg and Wethersfield are reported shorter on contracts than others.

## Forcing Sweet Peas.

Will some one that has had success in forcing sweet peas for winter flowers please describe his method of procedure. M. F.

DO YOU WANT a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

C. M. W.—The point you raise is rather too vague and indistinct for publication.

**Azalea Indica**, fine plants, now on the way from Ghent; we offer in original cases of fifty plants assorted in the best market sorts, including Deutsche Perle, Mme. van der Cruysen, etc., etc., in two sizes: the first or about 10 to 12 in. diam. of crowns for \$20 net the case; the second 12 to 14 in. diam. of crowns for \$30 net the case of fifty.

**Bulbs and Florists' Seeds** of all kinds; for full detail see our trade list, mailed free to applicants. Roman Hyacinths and Lily of the Valley Pips our two great specialties. Prices for quantities quoted by correspondence.

**Fenster Pappe**, the new German substitute for glass on frames. For detail see previous advertisements. We furnish original Rolls of about 110 yards for \$9.00 net cash. Trial Rolls, enough to cover four sashes for \$1.00 cash; these latter will travel by express for little cost, weighing below 10 lbs. Southern growers should not fail to try these; they will find this a most useful article that has come to stay.

**August Rölker & Sons**,  
136 & 138 W. 24th St., New York,  
P. O. Station E.

## CHOICE SWEET PEAS.

Being the largest growers of the above in the world the trade are invited to send a list of their requirements and secure low prices for Fall delivery.

FOR TRAILING

## SMILAX AND ASPARAGUS.

For sale by all leading Florists Supply Houses.

**JOHN C. MEYER & CO.,**  
289 Devonshire St., BOSTON, MASS

Denver.

The first severe frost of the season came September 23. We have all started the fires, which will be needed every night from now on.

Mr. T. Chapman has added two substantial rose houses to his plant. He is always cheerful as to prospects and a visit to his place will do anyone good. The Colfax Floral Co. are now in shape for winter.

We have been wondering where the boys were, but were rewarded at the last club meeting, when a good delegation came down. So one by one the places are giving us their encouragement.

Business does not look up, only as one who has been knocked over on their back and is too weak to get up, would naturally look up. Very good roses are already in but as all the retailers have glass of their own, and sales are slow, the prices are away down.

Very few places in the land are managed better or produce better results than the Red Leaf place under Mr. Sked's management. A really first-class place in the west is now a common occurrence and we are proud of it.

LYLE.

San Francisco.

Business is brightening up in the city now. Chrysanthemums are beginning to come in. Mr. M. Lynch of the Menlo Park Nurseries and Sherwood Hall Nursery Co. are now sending in the best violets, chrysanthemums, carnations, and roses. Mr. Lynch is still sending in large quantities of sweet peas.

John H. Sievers has been cutting some grand Ivory which find a ready sale.

Mrs. C. Halbrow, who has a fine store on Polk street, has always a crowd in front of her windows watching the fine display of chrysanthemums, etc.

Carbone reports business as fair.

The Midwinter Fair buildings are progressing rapidly and the florists expect a good winter trade.

## S. A. F. REPORTS.

GOOD READING CHEAP.

I have on hand a number of surplus copies of the  
reports of proceedings at the New York, Buffalo and  
Boston Conventions of the Society of American Flor-  
ists. All parties wishing to procure copies of either  
or all of these can have them by applying and enclos-  
ing 25 cents in stamps for each, as long as they last.

Address WM. J. STEWART, Sec'y,  
67 Bromfield Street, BOSTON, MASS.

## You Will all Want

The New Yellow Coleus GOLDEN CROWN.

As it takes all others yellows down;

And will soon be all the go,

Because so very easy to grow.

There is nothing Pale or Weak about it. You  
can't afford to run without it; \$3.00 per doz. Orders  
booked now for delivery November 1st, or as soon as  
ready. Or Gibson's beautiful scented Hybrid Pansies,  
2000 seeds \$1.00. Or Gibson's superb well mixed Hybrid  
XX and XXX Mammoth Verbenas, 2000 seeds 60 cts.  
and \$1.00. Trial packet of XXX for 10 cts. in stamps.  
No better for florists' use ever offered anywhere;  
our own growing from stock composed largely of  
Gibson's and Beauty of Oxford and the choicest selec-  
tion from the thousands of our fine seedlings, florists  
imagine, many of them will nearly cover a silver half  
dollar, and of exquisite beauty and fragrance, and  
richest imaginable colorings. Try a packet and realize  
all there is in the verbenas to date. Or the finest  
Double Fringed Petunia (Dreer's Strain), hybridized  
by hand, 1000 seeds \$1.50. Snow Crest Daisy, \$5.00 per  
100. Other specialties later. Cash with order please.

Address J. C. GIBSON, Woodbury, N. J.

## Fire Insurance.

As a member of the S. A. F. committee on fire insurance I was greatly pleased to read Mr. Scott's article on fire insurance in the FLORIST of September 21. If every florist would take the interest that Mr. Scott does data might be secured that would be of practical value to every florist in the land, and Mr. Michel's report to the annual convention next August would contain enough pith to keep the members awake for a whole evening session.

The main point is to make insurance companies recognize that all greenhouse risks are not alike, and just here I would suggest that every florist who is desirous of procuring fire insurance should procure a copy of the classification reported by the hail insurance committee and call the attention of his fire insurance agent to it, and then report the result to Mr. Michel.

Mr. Michel complains that his important questions are not being responded to as freely as the trade ought, but experience has taught the writer that only when a fire or hail storm comes knocking at his door can a florist be depended on to answer questions no matter how much to his interest to do so. Further, when writing to Mr. Michel give any ideas you may have concerning a trade fire organization. You may be able to suggest something that will overcome the obstacles against fire insurance at present in sight. Address E. H. Michel, Tower Grove and Magnolia avenues, St. Louis, Mo.

JOHN G. ESLER.

## He Was Paying the Bill.

SHE—Why do roses blush I wonder?

HE—Oh, I suppose the florist's prices make them ashamed.

# Trade will be Hard to Win

this season, especially Catalogue trade. You need to put an extra shine on, to pull the reluctant dollars. Your Catalogue ought to be better than ever, to secure attention.

This is just the time we shine; we can make your Catalogue brighter, cleaner, sharper—if it's honest! We will WRITE it, ILLUSTRATE it, as well as superiorly PRINT it; you see we can MAKE CATALOGUES, body and bones, from nothing but a list and prices.

We'll do any of the three things separately, either the Writing, Illustrating or Printing.

Now is a good time to arrange for the work; we'll send samples and write to you as to details, on application. Later, we will be greatly crowded with work.

20 lbs. KILLMRIGHT (Non-poisonous, but  
Death to Insects.)

—FOR \$10 CASH.—

Will clean your Greenhouses and out-door plants of Aphis, Mealy Bug, Caterpillar and other insects. Order through your seedsman, or direct of

ENDORSED BY LEADING FLORISTS  
EVERYWHERE.

WITH PROPER USE, SATISFACTION  
GUARANTEED.

TO STOTT GARDEN IMP'T CO., 136 Liberty Street, New York.

Dear Sirs:—We have been using your Distributer and Killmright for six months and consider it a good thing. It is the best thing ever got out. For roses it is particularly good. It cures a rose plant of black spot and mildew and keeps them in a healthy and growing condition. We never use tobacco smoke now. It will certainly ultimately kill the mealy bug. We will keep it right along and want nothing else.

Signed,

BOLANZ BROS., Akron, O.

## Express Rates.

From communications recently received it would appear that there are many in the trade who do not understand that they should receive the benefit of a 20% reduction from merchandise rate on all express shipments of plants "Completely boxed and packed so they can be handled without extra care." The "general special" rate is still lower, but is in force only between certain points and varies, but the "20% less than merchandise rate" applies to all shipments packed as described between points for which there is no general special. We print below the present classification of the express companies:

Plants: Completely boxed and packed so they can be handled without extra care may be charged for at general special rate. Between points where no general special is in force they may be taken at 20 per cent less than merchandise rate; pound rates, minimum charge 35 cents, prepaid or guaranteed. Plants: Not so boxed and packed, double merchandise rates.

## What a Vivid Imagination Will Do.

Referring to the flowering of a plant designated as a night blooming "cerus" a writer in the daily press says: "The stamens presented the appearance of a well formed cross, while the pistils looked like a crown set over the cross. This flower is supposed to be identical with the 'Passion Flower' of legendary fame, and emblematic of Christ in his relation to Christianity."

HOT WATER,  
STEAM.

# Automatic Ventilator a Practical Reality.

The Chadborn Automatic Hydraulic Ventilator maintains an even temperature under all conditions. Its operation is controlled entirely by temperature. Opens Ventilators any height and with any speed desired. Maintains temperature at any point, from freezing to 100 degrees. Costs absolutely nothing to operate. Is simple and durable in construction. Makes a handsome ornament in any house. Dispenses with all labor. Is guaranteed to do the work or machine removed. Considering its many advantages it is the cheapest device on the market.

READ THE FOLLOWING AND JUDGE FOR YOURSELF IF OUR CLAIMS ARE WELL FOUNDED:

MESSRS. CHADBORN-KENNEDY & CO., Fishkill, N. Y.

NEWBURGH, N. Y., April 25, 1893.

GENTLEMEN:—Replying to your inquiry in reference to the Chadborn Automatic Ventilator, of which I have 10 in use in my greenhouses to test their merits, I must say they have given me much pleasure in noting their workings—not having to *worry about the ventilation*, so as to have it done at the proper time, which is most essential to roses, because any overheating causes a fictitious growth, bringing on mildew; and this machine is there on duty always at the proper time, so that my roses were never in as good, healthy and vigorous condition, and clear from mildew as at the present time, April 25th, when mildew will usually make its appearance. But there is not a spot in all my greenhouses where this Automatic Ventilator is working. So, after this experience, I want more of your machines as soon as you can put them in, because they are labor saving, and always ready to do the work.

Very truly yours,

F. J. A. SCHAEFER.

 A postal card to our address will insure prompt attention and bring full particulars.

DELLE PIANTE NELLE ABITAZIONI is the title of an Italian work recently received, devoted to commercial floriculture and horticulture, including flowers for cutting, decorative plants, and also fruit. It is neatly bound in paper, and contains 72 illustrations. It is issued by G. Roda & Son, of Turin, who have sent out a number of other horticultural books.

## A GRAND EXHIBITION

### WORLD'S FAIR CHRYSANTHEMUM SHOW,

NOVEMBER 4 TO 12,

IN HORTICULTURAL BUILDING AT  
THE GREAT EXPOSITION.

\$6,000 IN CASH PREMIUMS AND  
40 WORLD'S FAIR MEDALS  
TO BE AWARDED.

World's Fair to be Open during November and the Chrysanthemum Show to be a Special Attraction.

Arrangements have finally been perfected for a grand chrysanthemum show at the World's Fair November 4 to 12. The exhibition will be held in the great Horticultural Building and the judges will award \$6,000 in cash prizes in addition to 40 medals of the World's Columbian Exposition.

It has been decided to keep the Exposition open during the first half of November and to make the chrysanthemum show a great special attraction during that time.

The management of the show will be in the hands of a committee of the Horticultural Society of Chicago, which will abandon its own projected exhibition, and a general committee consisting of Messrs. Robert Craig, Philadelphia; James Dean, New York; and E. G. Hill, Richmond, Ind.

The judges will be Messrs. E. A. Wood, West Newton, Mass.; Edwin Lonsdale, Philadelphia; and J. A. Pettigrew, Chicago.

While chrysanthemums will of course be the great feature, prizes will also be offered for roses, carnations, orchids and other specialties, and it is proposed to make the exhibition the most complete floral show ever held in America.

The crowds at the Fair now average over 200,000 a day, and as the railroads will make further special reductions in rates in case the Fair is held open after November 1, it is believed that the attendance during that month will be enormous. An extra fee of 25 cents will be charged for admission to the chrysanthemum show.

The American Chrysanthemum Society has been invited to act with the management and it is probable that that society will award certificates of merit to new varieties shown and that are deemed worthy by the judges of such distinction.

The premium list will be printed and issued in a few days. Among the leading cash premiums are the following: 50 blooms, one variety, white, \$50, \$35 and \$25; the same for 50 blooms of yellow, pink, crimson, bronze and any other color; best 48 varieties, one flower of each, \$50, \$40 and \$25, half of these amounts for best 24 varieties; best 12 vases, 6 flowers of one variety in each vase, \$50, \$40 and \$30; the same for best 6 vases, 12 flowers of one variety in each vase; 50 varieties cut flowers, 3 blooms of each variety, in vases, \$150, \$100 and \$75; 6 specimen plants, \$100, \$75, \$50; 3 specimen plants, \$50, \$35, \$25; and \$20, \$15 and \$10 for specimen plant of white, also for each of yellow, pink and crimson; best group of plants arranged for effect in 150 square feet of space, \$75, \$60 and \$50; best group of yellow varieties in 100 square feet of space, \$50, \$30 and \$20; the same to similar groups of white, pink and crimson; 100 plants, not less than 20 varieties or more than 5 of one variety, grown to single stem and bloom, \$100, \$75 and \$50; 50 plants in 15 varieties ditto, \$50 \$35 and \$25; 50 plants, white, grown to single stem and bloom, \$50, \$35, \$25; the same to 50 plants each of pink, yellow and any other color; 10 standards, distinct varieties, stem not less than 30 inches, \$100, \$75 and \$50; 5 standards ditto, \$50, \$30, \$20; specimen ditto, \$25, \$15, \$10; World's Fair medals to best seedlings, white, yellow, pink, crimson, bronze and any other color; medals to vases of 100 blooms of white, yellow, pink, crimson, bronze and any other color; medals to best single blooms on exhibition of white, yellow, pink and crimson; medal to best 12 blooms, any variety, introduced in 1892; \$100 for 12 blooms of best seedling on exhibition not yet disseminated; table decoration \$100, \$75 and \$50, and a host of other prizes equally valuable, including cut roses, etc., and floral arrangements.

The committee from the Horticultural Society of Chicago consists of President W. H. Chadwick, Secretary W. C. Egan, Second Vice-President J. A. Pettigrew and J. T. Anthony. These acting with Messrs. Craig, Dean and Hill, as before noted, form a board of seven directors for the management of the exhibition. Mr. Robert Craig has been elected general manager of the show, W. C. Egan secretary and Henry Holzapfel assistant secretary. Correspondence should be addressed to W. C. Egan, Sec'y, Horticultural Building, World's Fair, Chicago. The premiums are all guaranteed and will be paid in any event.

## Carnation Notes.

It is soon time to think of firing up, and don't be afraid to do it. It is "penny wise and pound foolish" to try and save a little coal at this end of the season. Better far let a little heat out at the ventilators than to have the plants chilled and checked just at this time as they are taking proper hold for the winter. None would think of allowing their roses to get chilled, and if they did the result would be a crop of the fungus we call mildew. Now, the carnation is not quite so tender as the rose, but the effects of the chill are there even if we can not see them at once.

If you are using steam run one pipe to a house, and if hot water make just enough heat to keep the temperature about 50°, at least not over 55°. Rather than have over the latter figure put on a little ventilation, but make it as little as you can, for the night air is not a desirable element in the houses after October 15. It is to be hoped that the automatic ventilator exhibited at St. Louis will prove practical; it would be quite a boon to be able to retire and know that your houses were in as good hands as such a machine would be.

To keep my houses at an even temperature I am using three thermostats, a four cell battery, an electric bell in my bedroom and some 800 feet of covered wire, costing, put up, about \$27. The whole outfit can be bought at almost any electric supply house and put up by any one who knows the first principles of electricity. These thermostats are set to ring an alarm with a variation of seven degrees in the temperature of the houses and have saved their cost ten times over in the health of the plants. They also compel the night man to do his duty, for if he did not they would report him better than any time registering arrangement possibly could. Where you depend on a man waking up at a certain time to tend the fires they are especially desirable, and no one will ever regret putting them in. Of course where the distance is not so great from house to greenhouse the cost will be considerable less.

Regarding a night man, every plant of 12,000 to 15,000 feet of glass or over should be able to employ one. In addition to tending the fires and making a round of the houses three or four times every night there is always enough work for him to put in the balance of his time. Making boxes, taking up cuttings, potting off plants or a hundred and one other things that can be nicely done after night. Do not employ the cheapest man you can find, but the best your place will afford; it does not pay to have a man who does not know how to tend a fire or who only thinks of putting in the time with as little work as possible until quitting hour comes. Such men are an encumbrance to any man's business and the quicker they are discharged the better. On the contrary if you see that you have a good man treat him like a man, let him know that his interest in your welfare is appreciated and pay him what your business will afford.

These remarks apply to all employed labor, and while not exactly carnation

notes they are applicable to a few of the places I have visited, and will bear a thought or two at the present time. One word more about the night man. I work mine from 6 p. m. to 6 a. m., and he always has enough to keep him busy excepting from midnight on Saturday until midnight on Sunday, during which time he has nothing to do but attend the fires and in the intervals he has access to horticultural journals, a novel if he chooses and the Sunday papers, also a few good cigars, but never anything to drink. I pay him what I feel able and we are both satisfied with the bargain.

Carnations should be staked as soon as possible after planting them. Some growers do not stake their plants, but this is a mistaken idea, as the competition we have to contend with compels us to produce a fine flower on a good long straight stem, and to get these results staking is a necessity. There are as many methods of staking as there are states in the Union. Last season I placed a stake in front of the plant next the path, one at the back of the last in the row and a stake between every two plants in the row. The string was then tied around the two stakes enclosing the plant between them, holding it upright without drawing it together tightly. This method was very satisfactory, all but the stakes, which, being wood, rotted off before the season was over. This time I am using iron stakes placed one at each end of the row and a No. 18 galvanized wire stretched through the center of the row and the plants tied loosely to it. This makes a very neat job and up to date I am well pleased with it.

As the plants start to grow the weeds will make their appearance, and it is well to remember the scriptural injunction that "cleanliness is next to godliness." Keep the weeds out, stir the soil and let it dry off pretty well before watering, as the sun will help to keep it sweet and healthy. It may seem like a big job to attempt to do this every three weeks, but it will pay, and like some more things is not such an awful job if you get at it and do it.

Now is the time to begin making notes as to how the different varieties are behaving themselves and their money value to you for another season. A careful record and comparison may have some surprises in store for you.

ALBERT M. HERR.

## Seasonable Hints.

Many of the large flowering varieties will soon be at their best, and should they be wanted for exhibition cut two or three days before they are fully developed and store in a dry cool cellar. By giving them fresh water every second or third day, and at the same time cutting off a little of the stem they can be kept in good condition for three weeks or more, in fact they will be greatly improved after a few days of this treatment. The dark varieties are apt to fade when unprotected from the direct rays of the sun, so it will

be necessary to give a little shading to these to ensure the best color. Light muslin, wax paper, or if the houses are kept dry tissue paper can be used for shading.

As fast as the flowers open keep a lookout for plants incorrectly labeled, and O. K. those that are right; by so doing you will be certain to have stock plants true to name. While the new varieties are not so likely to be mislabeled yet it is best to see that they compare with the descriptions.

Blooms are often sent the principal growers either for naming when the label has been lost, and in seedlings to get his opinion as to their merits. Such blooms often arrive in so poor a condition that the desired information cannot be given. I have received flowers that have been five days in the mail as fresh as though just packed, and again where only a few hours in transit that were spoiled. Whatever the object may be in sending it is always best to send some of the foliage, as it often assists in naming the variety, particularly where they have been grown under unfavorable conditions, and if a little damp moss is tried around the stem, and the whole wrapped in wax paper before placing in the box they will arrive in good condition if delivered in six or eight days. Flowers put in a dry pasteboard box without moss or wrapping are soon past recognition.

ELMER D. SMITH.

## Davallia Mooreana.

A strong growing light green stove fern, and if given sufficient room will make a plant thirty feet in circumference. It is almost insect proof, entirely distinct from many others of that family, and is greatly admired for its bold, broad, many cut fronds.

D. A.

## Dracenas.

Some nice plants of a few species and varieties of dracenas should be included in the stock of the general florist, several of these plants being well adapted both for house plants and also for decorating. Well grown specimens of moderate size are the most useful, very large plants being only suitable for exhibition or for an occasional decoration, beside occupying much valuable space in the houses.

The chief thing needed in the treatment of dracenas to insure success is liberality, these plants being in most cases gross feeders and soon showing neglect in this particular, the checking of growth by lack of nourishment for a time, usually resulting in inferior stock. Short stable manure of good quality, bone dust, soot and guano are all good fertilizers for these plants, but the last three substances named must naturally be used with more caution than is required in the use of stable manure only, but are quicker in action and give excellent results in careful hands.

Drainage of the pots should be good and the soil of open texture and not potted too firmly, while careful syringing during all bright weather is highly beneficial and especially so for the warm house varieties, these being somewhat subject to red spider unless given proper attention in this particular.

Propagation in most instances is effected by means of cuttings from either the stems or roots, though seeds of a few sorts are also to be had. Seedlings of *D. indivisa* are very easy to procure and are also quite variable in character, as to breadth and coloring of foliage, and in

SPECIMEN DAVALLIA MOOREANA.

large lots variegated forms are not uncommon, one of which has been named in Europe as *D. Doucetii*.

Of the green leaved dracænas with broad foliage *D. fragrans* and *D. australis* are among the best, the latter being more hardy than the former, though possibly not quite so ornamental, and may be used outdoors in summer for bedding out or for planting in vases or boxes with excellent effect. But with *Dracæna fragrans*, as with many other decorative plants, much depends on the way in which they have been grown as to how much exposure they will stand, and plants that have been reasonably hardened off before they are used will stand quite a good deal, in witness of which I have seen some that had been in frequent use in decorations all through last winter, and in the spring their color was still good, even though the leaves were much bruised and battered from frequent handling.

Of *Dracæna indivisa* it is not necessary to say much just now, from the fact that its virtues are quite well known and appreciated, both for decorating and also for outdoor use, while its ready adaptability to varying conditions of temperature make it what may be safely termed an all around useful plant. *Dracæna*

*stricta congesta*, commonly known as *D. congesta*, is another species of strong constitution and considerable beauty, and serves admirably as a house plant. The leaves of this variety are narrow, dark green in color and of leathery texture, the stems being very short jointed, thus making a very well furnished plant. This can also be grown in a comparatively low temperature and will withstand the exposures of decorating remarkably well.

*D. gracilis* is a pretty species of small growth, the leaves of which are quite narrow, bright green with a narrow margin of reddish bronze. This plant is very graceful in habit, easy to grow and useful in a variety of ways and deserves greater popularity.

*D. Goldieana* is another attractive species, and though not new does not seem to have become common. It has a compact habit and broad leaves that are handsomely variegated with a marbling of dark green and silvery gray. *D. Goldieana* is not so rapid a grower as some of the other species and requires warm house treatment to insure its welfare.

The variegated forms of *D. fragrans* are also handsome when in good condition, but the variegation is apt to become faded in the older leaves, and they are

possibly slightly more tender than the type, so can hardly be recommended very highly to the trade in general.

*D. terminalis* and *D. terminalis stricta* are among the best of the high colored section of these plants, and are truly brilliant when in good condition, the color showing while the plants are quite small and continuing during the active growth of the plant, or rather being more prominent on the young leaves. The ease with which these and also *D. fragrans* can be secured from the imported stems that are frequently in the market makes it a very simple operation to raise a stock, and it is better to get up a new stock each season than to carry over old plants, and there will thus be less risk of having unhealthy or vermin infested plants.

*D. amabilis* and *D. Guilfoylei* are good examples of the light colored types, the young leaves of the former being more or less marked with white and sometimes tinted with pink, while those of the latter are striped and blotched with white and the margins usually pink, making a most attractive combination.

Please mention the AMERICAN FLORIST every time you write to an advertiser.

## Miscellaneous Seasonable Hints.

It is about time now to give the earliest cinerarias their last shift, which with me is a standard 6-inch. Don't use sifted soil, rather let it be coarse and lumpy with plenty (a fourth) of good rotten manure. Remember that Cinerarias thrive in a very cool temperature but won't endure the slightest frost, and to do well must have the very lightest bench you have. There are few plants more troubled with aphids than cinerarias and in addition to regular weekly fumigation it will pay to spread fresh tobacco stems between the pots at short intervals. They need spreading out as their broad leaves begin to spread, and each time add some fresh tobacco. In many places you see cinerarias going off one by one, and it is attributed to a disease. In most cases it is I believe nothing but over watering. The cineraria is a cheap common plant, but to do it well requires the use of as much brains as it does to cultivate an orchid or the finest palm. They will not endure too wet a soil; once they droop with overwatering it is all over with them, and if too dry they droop their leaves but will recover with loss of a few leaves, so be most careful in watering them.

The earliest primroses will now take their flowering pot. With good sized plants it should be a standard 5-inch. Drain with a crock and piece of green moss. A light house with a night temperature of 50° is about right for them. Use a good light loam with one-third of leaf mould (not swamp muck) and a little sand added to it. I notice in some places that the primulas have to be supported with a small stick or brace upon each with a toothpick inserted in the soil. This is not necessary if they are potted sufficiently deep at their last shift. Pot them deep enough so that their crown is well firm with soil and they won't need any support, and they will send out roots from the collar which will be a help to them in their latter days.

Just as soon as you begin to fire steady and the sand in the propagating bed is warm put in Begonia rex cuttings, if pieces of the leaf can be called cuttings. If you don't get these begonias rooted early you won't have plants large enough to be useful next May.

Until you begin to get rid of chrysanthemums you won't have bench room for much of your Easter lily stock, and they have to remain in a cold frame, where they are doing all right for a long time yet; but keep them covered with sash or they will get too much water on many occasions. Those you are forcing for winter should now be a foot or more above the pot, and will now stand a temperature of 65° or 70° at night and warmer of course with sun heat.

Mignonette that was sown in July is now making fine spikes. It pays to take off all the side shoots down for a distance of 10 to 12 inches from the flower; below that leave them for future spikes. If you don't rub off these side shoots they much retard the development of the leading flower.

There is not so great a profit in paper white narcissus of late years, but the grandiflora type is fine and always useful, and at Christmas pays well. You may find a use for some earlier than that, but save the bulk of them for the holidays. Don't treat them at all as you would a tulip at that time of year, high temperature and shade, but keep them in a cool light house and bring them along slowly. They will then shove up their fine flowers

above the leaves. If forced in a high temperature and a shady corner leaves will be the principal crop.

Roman hyacinths can be had from November 1 on, and the earliest require plenty of heat.

Show pelargoniums that were struck in August should now be sturdy little plants and will soon want to go into a 4-inch pot, in which they will remain for the winter; and remember the best place for them is a very light bench or shelf. A low temperature (40° to 45°) at night is plenty and a very moderate amount of water until they start to grow rapidly, which won't be until the end of February or early in March.

For the next few weeks is the time to do any transplanting or dividing of your herbaceous plants, such as peonies, delphiniums, etc., and as winter comes they will be much benefited by a covering of leaves or litter of some sort. You have in clearing up destroyed the natural covering of these plants and must restore it in some way.

WM. SCOTT.

Buffalo, October 16.

Florists' Orchids.

By florists' orchids are meant such varieties as are of easy cultivation and free flowering, such as can be grown in an ordinary plant house. Of course the vandas, arides, saccolabiums and many of the dendrobiums are of no use to the average florist, as the high price at which the plants are held makes it impossible to cut enough flowers from them to pay interest on the investment. But you can always use to advantage the flowers of many of the cattleyas, dendrobiums, cypripediums and odontoglossums for they are all flowers that will keep; if you cannot use them this week you can keep them till next or the week after. Ten years ago there were a few orchid flowers to be had in the best florist stores in New York; now you can get them as regularly as roses from any wholesale dealer in cut flowers.

If you want orchids for cut flowers get good strong plants to start with, and give the plants a show. Orchids can stand a lot of abuse, but cannot, as many florists seem to think, take care of themselves. For the majority of florists' orchids you do not need, as many think, a special house, but you can grow them well in a shaded plant house such as you have your palms in, where the night temperature averages about 60°. Most of the odontoglossums can be grown in much lower temperature than that.

Cypripedium insigne is one of the best of all florists' orchids, as it is in flower about mid winter and is one of the easiest to grow, thriving in an ordinary greenhouse. Give them plenty of watering growing season, and never let them get too dry at the roots. They must have liberal drainage in the pots, and do best in a mixture of fibrous loam and peat, but where you have no peat do well in fibrous loam alone.

Dendrobiums are another free flowering species, of which *D. nobile* is the best for florists' use; although there are others as free flowering as *nobile* it is the best all around variety. *Dendrobium nobile* does well either in pots or baskets, given

good drainage and potted in fibrous peat and chopped sphagnum moss. When growing they should have plenty of moisture both at foliage and roots, but when done growing should have more air and only water enough to keep growths from shriveling, for it is necessary to have the growths well ripened to insure good flowers.

Cattleyas are among the grandest and showiest of all orchids, and of easy growth. *C. Trianae* and its numerous varieties are the best for florists, as it is a winter bloomer. In a batch of plants imported from the same locality no two will be alike, the shades of color vary so, but are all worthy of cultivation. *C. Mossiae* and its varieties are fine, but are summer flowering. *C. labiata* when true is a grand florists' orchid, and blooms early, in fact before *C. Trianae*. Cattleyas do best in pots or baskets potted in fibrous peat, elevated about an inch above the edge of pot, so that there is no danger of water at the crown. When in growth, and they usually commence to grow as soon as done flowering, they should be kept moist, not wet, and when done growing give plenty of air, avoiding cold drafts, and keep dry to ripen the growth, but not so dry as to allow the growth to shrivel.

The *laelias* are useful and easily grown orchids. *L. anceps* and *L. autumnalis* are among the most useful and easiest grown species. *L. anceps* does best with the same treatment as the cattleyas, while *autumnalis* does best on blocks, and does not require as much heat as some of the other varieties.

*Coeogyne cristata* is one of the handsomest cool house orchids grown, and its delicate white flowers are very useful. It does best in pots in peat and moss; give good drainage and plenty of water in the growing season, but keep water off the flowers, or they spot and go black. *Lycaste Skinneri* and its varieties are grand florists' orchids, and of easy growth, and they can be grown in a cool house. Grow in peat in pots with good drainage and when in growth give a liberal supply of water; in fact they should never be allowed to get dry at the root even when at rest. There are a great many other varieties of orchids that are of easy growth, but the varieties I have named are amongst the most useful for the florist and of easy cultivation and free flowering. When purchasing orchids remember the best are the cheapest, and do not buy weak little plants because they are offered at a low price, but get good plants. They are cheap enough now, buy them from a responsible firm, and they will give you much pleasure as well as profit. If you have had no experience in orchids buy established plants, but if a judge of them you can do best by buying unestablished freshly imported plants.

JAS. S. TAPLIN.

Madison, N. J.

## Insects Injurious to Aquatics.

ED. AM. FLORIST:—A week or two ago, in the FLORIST, you referred to the damage done to the nymphæas and nelumbiums in Lincoln Park by a couple of insect pests, and promised your readers should know the result of an appeal to Prof. Riley for knowledge of ways and means of fighting them; enclosed you will find reply by L. O. Howard, acting entomologist in the absence of Prof. Riley.

Our remedy in the case of the nelumbium pest has been to hand pick, but too often the fellow had already bored himself out of sight and injured the leaf stem; and for

SPECIMEN DAVALLIA FIJIENSIS.

fear of poisoning the fishes, we hesitated using arsenical preparations on the nymphæas, though we used tobacco powder with partial success. Some of your readers may have experienced the trouble, and may be able to offer suggestions of value.

J. A. PETTIGREW, Supt.

Chicago, October 13.

J. A. PETTIGREW, ESQ., SUPERINTENDENT LINCOLN PARK, CHICAGO—*Dear Sir:* In the absence of Prof. Riley I beg to acknowledge the receipt of yours of 4th instant, together with accompanying specimens. The sending proves to be a very interesting one. I am unable to find any reference in the division of either insect sent. One is a Tortricid lepidopterous miner and the other is a dipterous larva. The latter is the one which mines the surface of leaves and while a few of the larvæ were living when received we have so far been unable to breed anything from them and cannot determine the species from the larvæ alone, as little is known of the early stages of these insects. We shall endeavor to rear both the larvæ and the dipterous insect, and it may be that we can suggest remedies when the full life history has been worked out.

L. O. HOWARD, Acting Entomologist.  
Washington, October 10.

#### Davallia Fijiensis.

When seen from a distance this grand fern has more of the appearance of a filmy fern than a davallia. It is as dark green and as gracefully formed in the frond as *Todea superba*, although of different habit. It requires a warm, shady house to grow it well. Both the fine specimens of davallia shown in our illustrations were grown by Wm. Martin, gardener to N. T. Kidder, Milton, Mass., and for the latter species he was awarded a silver medal.

D. A.

#### A Promising Vine.

While on a visit to the nurseries of Mr. M. Cook I was very much interested in a white flowering vine which I saw growing there. It grows most luxuriantly and for freedom of blooming cannot be beaten. Mr. Cook has been cutting abundantly from it for the last two months, and it gives every promise of continuing so until cut by the frost. For store work, designs, etc., it has no equal, and I predict a great future for it when once it becomes known in the north. Trained over the rafters of a house I have no doubt it would bloom all winter. I enclose a spray for your inspection and

would be pleased if you could give us the name of it. It reminds one of a dioscorea; it has roots just like a sweet potato. The flowers last a long time when cut. It was given to Mr. Cook by a lady from South America. The more one sees of the flower the better you like it. The vine (as you will see) is a good deal like the *Aristolochia elegans*, but I feel quite sure it does not belong to that family.

New Orleans, La. HARRY PAPWORTH.

The loose spray of small white flowers was very pretty and they stood the long journey exceedingly well. It would certainly be very useful in cut flower work. Being unable to identify it we sent the specimen to Mr. Wm. Falconer, who writes as follows:

"The name of this little flower is *Agdestmia clematidea*. It is a native of Mexico and Brazil, and belongs to the poke weed (*Phytolaccaceæ*) family of plants. It is an almost unknown plant in cultivation."

THE REPORT of the St. Louis park commissioner for the year ending April 11, 1893, recently received at this office, gives a full account of the various improvements in the parks of that city, and is attractively illustrated.

## Greenhouse Construction.

Evenden Bros., of Williamsport, Pa., have been kept busy during the past summer, in enlarging their greenhouse establishment by the addition of two 18 foot three-quarter span rose houses, with a propagating house at the back, and a violet pit at the front of each, also an 18 foot even-span carnation house. All the houses are 110 feet long, and as there may be some points in their construction of interest to your readers I send you a sketch of a cross section showing the arrangement of one of the blocks.

The woodwork from the posts up is entirely of cypress, drip grooved, cap bars being used, as the glass is butted. In the rose and carnation houses the ridge supports are 1½-inch pipe screwed into a cap fastened to the ridge; the purlin supports are 1-inch pipe; the purlin is 1-inch pipe run through 1½-inch tees with an inch outlet to secure the supports. In getting the purlin to its place firmly, a very important matter, a stout nail was partly driven into every eighth sash bar where the purlin was to come; the purlin, all screwed together with the tees for the supports in the places, was lifted to its place and held against the nails by temporary supports, the straps were then put on, one on every fourth bar, the purlin was then pressed upwards so as to slightly curve the sash bars, this greatly strengthens the roof and prevents sagging. The supports were then cut and screwed into place.

Piers for the ridge and purlin supports were made by digging holes about eighteen inches square and eighteen inches deep; these were filled with concrete and a flat stone placed on top. Piers like these are easily and quickly made and make an excellent foundation.

In placing the benches care was taken to keep the back of the side benches clear of any drip that may come from the gutter. This is another very important matter which is sometimes overlooked, for whether the glass is butted or lapped there is always more or less drip in wet weather which should never fall on the benches.

In the propagating houses the space between the back of the bench and the side of the house is covered by loosely fitting boards about four feet long, which can be lifted off on very cold nights or any time when it is necessary to increase the top heat.

The violet pits are covered with six-foot sash; these are hinged to a purlin about fourteen inches from the side of the gutter; the space between the gutter and purlin is boarded, with three-foot ventilators six feet apart; these are also hinged on the purlin; when the sash is lifted in front and the ventilators open there is a thorough circulation of air, which will be very beneficial to the plants in the dull winter days.

The pathway at the back of the pits is very convenient, affording a means of easily picking the flowers, watering and otherwise attending to the plants, no matter how severe the weather.

The heat used is steam, part overhead and part under the benches. There are three overhead 1½-inch flow pipes, and six return pipes the same size under the benches; one flow pipe feeds two returns. The overhead pipes and also the return pipes under the middle benches are run through hangers, which are slipped on the ridge and purlin supports and held in place by a set screw (*the hangers should be put on the supports before the latter are secured in place.*) These make the best

GREENHOUSE CONSTRUCTION

and neatest pipe support I have yet seen.

One point I must not omit mentioning, is that all of the timber in the benches and sides of the houses have been treated to a liberal coat of crude petroleum before being used. This is one of the best preservatives for benches there is. A coat of crude oil applied to a bench once a year will make it last twice as long as one not so treated.

J. P. RING.

## Nephrolepis exaltata.

A handsome fern, much in use for decorative purposes in warm dwelling houses. It can be increased rapidly by division and in quantity from seed, and will thrive in any porous, well drained soil. It is grand either in pot or basket and its long, drooping, graceful fronds are seen to best advantage when the plant is suspended. The specimen shown in our illustration was grown in two years from a small plant by James Wheeler, gardener to J. H. White, Brookline, Mass., and for it he received a silver medal from the Mass. Horticultural Society. D. A.

## Philadelphia.

The van of the chrysanthemum army has appeared with Mme. Bergmann leading, closely followed by Kate Brown and Gloriosum. R. Scott & Son were first in the market on the 10th with Mme. Bergmann, a good medium sized white; they brought \$2 per dozen. Kate Brown was next on the 12th from Hannum & Co., Wilmington; this is a good medium white, Gloriosum was sent in on the 13th; they were really good flowers raised by Samuel Bunting of 59th and Elmwood avenue. Mr. Bunting is little more than a novice, having been but a short time in the business, but he has beaten out most of the more experienced ones. His flowers brought \$2 per dozen. Mr. Heacock began cutting October Beauty on the 14th and brought in some nice disbudded stock with large flowers for this variety; these brought \$1.50 a dozen, to which price the others have dropped by this time. Many growers are canvassing the stores for orders for next week and it looks as if the market would be flooded in a very short time.

George Uber is first in with plants in pots, having some good Mme. Bergmann in 8-inch pots in good flower; these brought \$1 each.

Mrs. Whilldin and Jessica are both promised for Monday, with Ivory and Mme. Girard a possibility. Although the flowers have been good they have not sold as fast as one would think they should on account of their novelty. Business, however, has not had any snap to it the past week; the weather has been too warm. What is wanted is a killing

frost and a few cold days that will make folks think of winter. Roses are very plentiful and job lots are the rule. Some few growers get \$4 for selected teas, particularly La France, but the majority are being sold, first choice, at \$3. Kaiserin and Meteors bring \$5 to \$6; Perles, Cusins, Wattervilles, \$2; Gontiers, \$1 to \$1.50; Belles and Beauties, \$1.50 to \$2 per dozen. Burton is cutting some fine Belles and promises something extra when the weather gets cooler. Lonsdale has very fine Kaiserins and his exhibition mums, it is said, will be in fine shape for the show.

Carnations are continuing to improve and have stiffened a little in price, moving from \$1 to \$1.25 for the choice. It looks now as if there will be a great abundance of this popular flower the coming season.

All kinds of outside flowers are very plentiful; dahlias are finer and in greater variety than we ever remember seeing them before. Pennock Brothers made quite a show of these flowers in their window the past week. Cosmos can be bought by the wagon load. The African residents who peddle the flora of Jersey on our streets during the summer months have caught on to the cosmos and added it to their assortment, and some seem to be making it their specialty. Market street near 12th is lined with every kind of receptacle from buckets to washtubs and clothes baskets full of this flower. Growers and dealers have asked 50 cents a hundred for it, but now it is almost given away. Valley is plenty at \$3 and \$4. Violets are selling better, the single variety bringing \$3 to \$4 per hundred bunches of twenty-five flowers to a bunch. Marie Louise are getting to look like something and sell for 50 cents a hundred. Smilax is plenty at \$15; very little asparagus in strings as yet, though good sprays can be had at 50 cents per bunch.

Campbell & Kennedy of Broad street and Germantown avenue have dissolved partnership, Isaac Kennedy withdrawing from the firm, which will be conducted hereafter by Mr. George Campbell. Here is a chance for somebody to get a good foreman, as Mr. Kennedy is anxious for such a place; he is a first class man and not likely to remain long out of a position.

Mr. Harris' fame as a grower of palms, rubbers, etc. has extended all over the country. New York knows him well and after repeated urging he is now going to Boston, where N. F. McCarthy & Co. are to conduct a sale of his products. Boston has the reputation of being a good market for good stock, and Mr. Harris' heart should be gladdened with the returns.

Secretary Farson is about again and able to attend to his duties, having been

SPECIMEN NEPHROLEPIS EXALTATA.

at a meeting of committees at the library Thursday last. He reports prospects for the coming show as good, many entries being made by old exhibitors, as well as quite a number of new ones.

George Craig has become a grower on a small scale, his greatest success being with lycopodium, of which he has grown quite a lot the past summer in pans for table decoration. It seems to have done best in his bulk windows, and when asked by a friend how he accounted for his success he leaned forward and, tapping his pencil on the large pane, he said: "It's all on account of the plate glass."

Z. De Forest Ely is enjoying a well earned vacation in Chicago, where he has been visiting the exhibition the past week.

Thursday night last will not be forgotten for a long time by the bowlers who were fortunate enough to be present at the match between the McLean and Craig teams. The McLean team were not in it—have not been for the past three matches for that matter—and as a consequence new teams were selected, of which W. J. Baker and R. Kift are to be captains. The bright particular event of the evening, however, was the bowling of George Craig, who placed the record of the alleys for the highest single game and the total for three games so far above anything before accomplished as to make the old record of 246, held by George Anderson for a single game, and John Westcott's 595 for a total of three games,

both of which have stood for eighteen months, look insignificant. Mr. Craig's score was—first game 169, second 283 and third 202; total 654, an average of 218 to a game. In his big game he started with a spare and then all strikes until the last ball, with which he only secured three pins. The enthusiasm his great score aroused as strike followed strike was enough to have unnerved most players, but George kept his head until the last and was heartily cheered by all present. This score has seldom been equalled on regulation alleys where pins are twelve inches apart. K.

#### New York.

The week just passed has been an unprecedentedly dull one in the cut flower business. It takes a good many hard knocks to discourage the dealers; generally when they report poor trade their report is coupled with a hopeful prediction of speedy improvement, but in the present instance one can not fail to see that there is widespread anxiety felt regarding the outcome of the coming season, and a deep settled conviction that the craft will require close attention and careful sailing unless all signs fail.

There is quite a supply of chrysanthemums coming in now, and the cut rapidly increasing each day. The prices prevailing in past years for early blooms are not obtainable this year. Prices are already at about the same point as they

were in the height of the glut last season. It is impossible to realize over two dollars per dozen at wholesale for the best selected blooms now in the market. While far from equal to the selected flowers that will come later, yet these blooms are real good, and the question suggests itself: If they bring but two dollars now what will they be worth when the main crop appears?

Carnations, roses and violets are all plenty, but buyers are few, and small orders are the rule both locally and for shipment, so that there is an overstock on everything. It ought to be an easy matter to comply with Mr. Dean's request and make Manhattan Day at the World's Fair a most notable one as far as cut flower decorations go, for there is an abundance of everything to spare.

There are some fine blooms of the new rose Mrs. W. C. Whitney being received from J. N. May. In form, color and fragrance it seems to have all that can be desired for a popular market rose.

A. H. Hews & Co. have offered to provide all the vases which the N. Y. Florist Club may require for its monthly exhibitions.

*American Gardening*, formerly published by the Rural Publishing Co., has been bought by the A. T. De la Mare Printing and Publishing Co.

John Raynor, of Burns & Raynor, celebrated his wooden wedding on Oct. 10.

Prof. Wittmack sailed for Germany this week.

#### Buffalo.

Two weeks of bright warm weather and a rather dull week's business has made flowers a little too plentiful to be healthy all round. Roses have been in great abundance and surplus lots have been sold very cheap. There is very little outside stuff of any use at this date and a change to more wintery weather will soon shorten up the supply.

On Saturday last Buffalo was visited by the great storm which is no doubt wide in extent and has caused a great loss of life and property. I have not yet heard of any serious loss to greenhouses except that loose glass took its departure for parts unknown.

A very few chrysanthemums are making their appearance in town, but another week will see the "mum" season open in earnest. I hear no growers or retailers but what express themselves as confident that the popularity of the chrysanthemum will be as great as ever. It is sincerely to be hoped it will be here, for there is a big crop to be disposed of.

W. J. Palmer & Son have an immense lot of fine flowers coming in; so has W. Scott, Webb Bros., of Corfu, J. H. Restock, C. F. Christensen, G. S. Pickleman and many others in lesser quantities. For the past three weeks W. Scott has been cutting some fine flowers of Deleaux. If well done this useful section could be had in fine shape by the middle of September, and surely must be useful then.

We hear of another store to be started on William street by Mr. John Pickleman, Sr. Trade must be good on that busy east side thoroughfare.

Mr. Fry and Mr. Pridmore, of Rochester gave several of our florists a call last week, chaperoned by D. B. L. A few of our British born florists who have lived here 25 years are just about to become full fledged citizens this week, and look forward to casting their first vote early in November. It would do you good to hear the political talk that emanates from them. They are of more consequence to

the community politically than old men who were born here.

As the time approaches for chrysanthemum shows we hear regrets from many citizens that our city has dropped out, but the great majority of the florists think it was a wise move and a rest of one year may give the public an increased love for such refined exhibits. W. S.

#### Cincinnati.

The monthly meeting of the Cincinnati Florists' Society was called to order by Pres't Critchell October 14, with the largest attendance that the society has had for months. The special order of business was the incorporation of said society under the laws of the state of Ohio. As our handsome floral market is nearing completion the interest among the members and growers continues to grow, and by the time the building is finished we expect to be in readiness to open same with ceremonies appropriate to the occasion.

At this meeting we had the pleasure of a visit from Mr. E. G. Hill, who brought for exhibition a dozen magnificent blooms of his new chrysanthemum, Mrs. E. G. Hill. This variety is of the Japanese incurved type, a seedling from Puritan, fertilized by Mrs. Hardy. It is pink in color and very early. The flowers measure fully seven to eight inches across. He also had on exhibition a vase of the new white carnation Uncle John, which is also deserving of much praise.

One of our own growers, Mr. Dick Witterstaetter, also had some chrysanthemums on exhibition which were second to none, as follows: Miss Rosa Kupferle, a deep rose pink, shades light, petals standing out and twisted, fine foliage and strong, stiff stem, a cross between Gloriosum and Princess and blooming same time as Gloriosum; The Debutante, a "pure white," same style as Rosa Kupferle, but ready for market fully a week earlier; No. 102, a large fluffy white flower opening with a whorl in center, with the petals falling irregularly. Mr. W. also had on display quite a number of new seedling carnations deserving of special mention, and which will be heard from later.

Mr. Fred Walz, well known through his introduction of the now celebrated Queen, had on exhibition a seedling white chrysanthemum in the way of Mountain of Snow, flower high in center with petals falling to stem; it is certainly an acquisition and will be heard from later; foliage grand, with very stiff stem. He also displayed some very handsome seedling cannas.

Mr. Richard Smith exhibited several pots of new seedling chrysanthemums, consisting of yellow, white and pink flowers. The special one of merit is the yellow incurved variety; the light pink is the same kind of flower. All were good sized and very early.

Mr. Peter Herb had on exhibition his now celebrated carnation, Adelaide Kresken. This is the same carnation that received the first class certificate at St. Louis in August and is a grand pink carnation, being an unusually large flower with stiff stem, no bursting of calyx and fine in every particular.

Taking all in all, we may say that Cincinnati has had the first floral exhibition and display of chrysanthemums for 1893.

The cut flower trade in this city remains unchanged; little doing and plenty of stock to supply all demands.

There will be a special meeting of this

society at the store of J. M. McCullough's Sons Saturday evening, Oct. 28. Let every member be present.

E. G. GILLETT, Sec'y.

#### St. Louis.

During the past week the last regular meeting of the Florists' Club (preceding the chrysanthemum show) was held, and was fairly well attended. The various committees reported progress and several showed evidence of work in the shape of posters, tickets, etc. The report of the committee appointed to procure estimates on the cost of printing and mailing 3,000 announcement cards to parties whose names are taken from the blue book, stirred up considerable discussion regarding profitable methods of advertising. The amount (\$50) was approved, however, and the cards will be issued.

Another subject was brought up which has been a stumbling block ever since the shows have been held; it refers to the use of china and glassware in a table decoration. The first year they were allowed, this was not satisfactory, however, and the next year they were allowed under protest as it were, the following footnote being printed with the announcement of the premiums: "The use of expensive china or glassware will not be considered in the decoration." This was also unsatisfactory, and the present year the announcement was made that "the artistic arrangement to be the first consideration and to consist of nothing but plants and flowers." It now appears that this is unsatisfactory, as it will exclude the use of wire frames, moss and many things which enter into the make up, if the wording is to be strictly adhered to, and which it was never meant to exclude. Owing to the absence of several parties who are usually exhibitors in this class the matter was referred to the exhibition committee, who have notified all possible exhibitors to appear before them at their next meeting and see if the matter can not be amicably arranged.

Mr. Carroll showed some fine carnation flowers and adiantum fronds at the meeting, upon which he was complimented; he has most all the newer varieties of carnations, but says the best are all in Dorner's set.

The auction held by the Michel Plant and Bulb Co. of palms and other stock was rather slimly attended. The prices realized upon good stock were fair, but stock that was not in demand for decorating was a drag and went low.

Chrysanthemums have made their appearance, Gloriosum having been received from the south on the 11th and 12th. No white varieties arrived until the 14th. The stock is not extra and sells for 6 cents; a few of much better quality went for 8 and 10 cents at once. R. F. T.

#### Chicago.

Business is fair and there are but slight changes in prices. Roses have slackened up somewhat, a good many growers being off crop. Carnations are improving, some nice Daybreak and Edna Craig being among the fancies, and there are also good Silver Spray. Cosmos is very limited in quantity. Few good violets are seen from local growers, some of the best coming from outside points.

Chrysanthemums are here, and they will soon be in with a rush. Gloriosum and Domination lead, with a few Ivory and some small whites of mediocre grade. A lot of chrysanthemums are being re-

ceived from the south, outdoor flowers, but grown to a single stem. They are really good, not specimen blooms, of course, but very fair in quality. Quite a sensation has been caused by the new early pink Mrs. E. G. Hill, grown by E. G. Hill, of Richmond, Ind. A limited number of these flowers has been received this week; they are very much admired, and are really the only good pink now obtainable. The flower is very large, incurved, color when fully open a clear pearly pink. Prices for chrysanthemums so far have ranged from \$2 to \$4 a dozen, the latter price being obtained for the specimen blooms. Of course it is likely that the price of roses will be affected by the chrysanthemums, but we can not expect to do without these showy autumn flowers, they are part of the trade.

M. Jules Lemoine, superintendent of the Bois de Vincennes, who is in charge of the French horticultural exhibit at the World's Fair, is collecting statistics regarding the principal American parks, at the request of the chief engineer of the park system of Paris. M. Lemoine expects to return to Paris at the close of the Exposition.

Among recent decorations P. J. Hauswirth has made some very effective arrangements of Grace Wilder carnations. This flower was used by him at a large dinner; the favors for the ladies, fifteen in number, consisted of loose bunches, one hundred carnations in each. These bunches were arranged in a graceful plateau in the center of the table. The banquet given to the visiting members of the Carriagemakers Association last week was decorated by Mr. Hauswirth, loose flowers in vases being used.

Miss Eloise, daughter of Mr. J. A. Pettigrew, superintendent of Lincoln Park, will be married to Mr. George T. Sisson October 25.

Recent visitors: E. G. Gillett, Cincinnati, Ohio; John H. Taylor and wife, Bay-side, N. Y.; V. H. Hallock, Queens, N. Y.; Mrs. E. Sader, Toledo, Ohio; Z. De Forest Ely, Philadelphia; D. F. Lightfoot, Findlay, Ohio; Luther Armstrong, St. Louis, Mo.; L. Bauscher, Freeport, Ill.; W. E. Hearne, with Kemble Floral Co., Oskaloosa, Iowa; Mrs. D. J. Knox, Butte, Mont.; Chas. H. Keitsch, Buffalo, N. Y.; G. Van Bochove, Kalamazoo, Mich.; E. N. Burt, Goshen, Ind.; F. A. Scharff, New York; O. Wheatley, J. Satterthwaite, Denver, Colo.; Lucius H. Foster, Boston, Mass.; Wm. Seite, New Orleans, La.; Geo. W. West and Mr. James, Bermuda; J. E. Bonsall, Salem, O.

#### The World's Fair.

The banquet to the foreign commissioners October 11, which took place in the great Music Hall at the Fairgrounds, was the social event of the exposition, and the decorations were in proportion to the magnitude of the event. The Music Hall is in style admirably adapted to showing off decoration, and the floral part was under the superintendence of Chief Thorpe, while the arrangement of the bunting which covered the walls was in charge of the well known artist, F. D. Millet.

The white columns around the hall were twisted with garlands of oak leaves. In the niches above the columns were palms and other foliage plants, while the wall beyond was gay with the flags of all nations. The gallery railing was garlanded with flowers and flowering plants. The entrance at the east end of the hall was almost hidden by palm

NEW CHRYSANTHEMUM MRS E. G. HILL.

and large bay trees. A number of bays were used in the plant groups. The stage was a mass of fine plants, the music platform being built out in front of it, so that the plants above formed a background. At each of the four sides of the hall were fine groups of plants, the only variation being in the group at the back of Mr. Gage, who occupied the seat of honor, where chrysanthemums were used.

On the tables the decorations were arranged in low plateaus, so as not to interfere with the line of vision. Pink and yellow roses were chiefly used, and there were some beautiful effects produced by the use of the electric light among the flowers. The arrangement of the tables was that of an ellipse in the center with a cruciform table at either end. The effect of the plants against the background of flags was very brilliant, and rare skill was shown in the arrangement of both plants and flowers. The stair-

case was only decorated by oak festooning, woven around the balustrade, and large bay trees at the bottom. Mr. Thorpe was assisted in the arrangement by George Thorpe and H. M. Hughes; the decorations involved a large amount of work and a tremendous amount of material, but its beauty brought warm praise from everyone who saw it.

In the greenhouses the Brazilian caladiums are still fine, and in a short time there will be a brilliant show of chrysanthemums. In the large building there is naturally a dearth of flowers at present, which seems a disappointment to the many visitors whose only idea of ornamental gardening is an abundance of bloom. The smaller greenhouses, however, are still very gay. Outside only a few of the hardiest blossoms still remain, for we have had several sharp frosts, followed by extremely cold winds, trying to legetation of all kinds.

#### New Chrysanthemum Mrs. E. G. Hill.

Specimens of this fine new early pink chrysanthemum were passed upon by the judges at the World's Fair October 16, and the exhibitor was awarded a medal and diploma, the points noted in the latter being earliness, size, form, color and vigor of growth. It is a seedling from Puritan and Mrs. Alpheus Hardy and has the fine form of the latter variety, but the color is a beautiful pearly pink. Flowers were sent to this office at the same time, and they were certainly magnificent blooms, the best we have ever seen at this season of the year. The accompanying life size engraving gives a good idea of the flower except as to color, but each of the blooms sent us were on stems exceeding four feet in length and clothed with handsome foliage.

Please mention the AMERICAN FLORIST every time you write to an advertiser.

## Elevating the Profession.

In reading a recent article bearing on the elevation of the profession, I was much struck with the forcible nature of the remarks on untidy and slovenly greenhouses. Truly, there is much to be said on the subject, and it can scarcely be said in too vigorous or dramatic a manner. It is to be hoped that the author of the article will keep pegging away until he creates a sentiment quite in accord with his own in the matter, and as a result of the breeze he raises everything except clean, dry, cheerful greenhouses will be swept out of Uncle Sam's entire domain.

I may say that I have some feeble anticipations of living to see the day when each house of them will be built of iron and plate glass, ornamented with brass and nickel or aluminum, and with tiled walks, possibly further fitted for the pressure of dainty slippered feet by a strip of Brussels carpet laid along the center; to say nothing of an office in connection with each group, elegantly upholstered and carpeted, with a few choice etchings on the walls and a neat little buffet in a corner, whence the fashionably attired proprietor might extract a glass of liquid refreshments for his customer wearied with the walk around his spacious conservatories; or a piano, where the aforesaid customer might, while having his or her fifty dollar nosegay carefully selected and tied up, pass a pleasant half hour rendering selections from Chopin in A sharp or B flat, or some other suggestive key.

To be sure my aspirations in that direction are not very strong or particularly hopeful, but an age that can transform a dusty, gritty, noisy railroad car into a smoothly gliding dream of luxury and beauty can surely accomplish something in the aesthetic uplifting of a business which the article in question characterizes as "delightful," but which is essentially a dirty, wet manure and whale oil soapy affair at its best. Another thing that faintly encourages me is this: Right here, south of Mason and Dixon's great and never-enough-to-be-praised line (for it hems in the utterly bad in the eyes of our friend), I have seen a cow stable—mark what I say—a cow stable, with strips of carpet laid in the alleys and pictures hung on the walls round about, with never a sight or smell to offend the most fastidious, and having an office in connection therewith where all the comfort and good cheer so markedly absent from greenhouse offices was to be found. And this cow stable was run for money. But I never heard that it made any, though hundreds of less carefully and aesthetically managed establishments right in the same county yielded a comfortable income to their owners.

To be perfectly serious, I have lived south of Mason and Dixon's line a long time, and a greenhouse establishment where customers are habitually treated to heaps of rubbish during wet weather, or in a thaw to mud ankle deep, I have never seen; neither have I ever seen a greenhouse, either north or south of the said line, that was not occasionally, during the year, either by reason of repairs or some one of the numerous changes that are made in pot plants, or fertilizings, etc. of bedded plants, made very unpleasant for any visitor.

The comparison that is drawn in the article between the neatness of the average farmer and the average florist has at least the merit of being original in awarding the palm to the farmer. It is certainly not carried out by what I have

seen of the two professions; and the further comparison that is drawn between the employe of the farmer and the employe of the florist is to speak mildly of it startling. This is at least the keynote of the dissatisfaction that a four years wandering acquaintance with the "delightful" business has engendered. The florist hires slovenly, cheap men, the farmer intelligent, neat, presumably high priced ones. Our friend is with the florist and feels himself better than his surroundings, above his fellow workmen, superior in judgment and ability to run the business as it should be, to even his employer, and all after a four years' trial of the business, scarcely enough, had he remained in one place and confined his attention to the unattractive details of it, to make him a competent under gardener. This is a common complaint, and I doubt if an employer who reads this article has not, if he employs many men, met with cases of it very frequently. It is this lily fingered disinclination to engage in a business where there is so much actual contact with dirt that keeps the profession in the hands of the foreign born so largely. It is the disposition to compare one's business unfavorably with others that makes careless and self-satisfied workmen, sows the seed of discontent in a whole force of hands and tempts many a well meaning and hard working employer to language more forcible and expressive than elegant as he considers the result of a few months' tarrying by him of some elegant young gentleman whose politeness and neatness made poor amends for his conceit and general incompetency.

Our friend makes one serious misstatement which I would like to correct. He says "There (i. e., south of Mason and Dixon's line) black and white, tramps and otherwise are always on a parity." South of the line, if there is one thing that is more certain than another, it is that white and black are never considered equal. More's the pity. Why does Mr. Gattson object to them being equal? If a black man does as good work as a white man and is equal to him in other ways, which is quite possible, why make a difference on account of color?

It is to be hoped that Mr. G. will speedily get him a greenhouse or two and let us see by example how to do it. If he does not after four years' experience as an employer modify his views very considerably it will be a wonder; in fact I apprehend his verdict will be that the florists of the country, north and south, are as neat as their circumstances and means will possibly permit them to be; that they are only too anxious to get, keep and pay neat and intelligent help—providing the neatness and intelligence are not offset by conceit, insubordination and indolence; that they are, compared with average farmers, greatly superior, more industrious, more capable of permanent organization, more imbued with a love of the beautiful, more successful financially, wiser business men, neater in person and premises, pay better wages, employ better help, work them fewer hours, treat them better personally, and are, last, but by no means least, utterly incapable of being divided by sectional lines, whether of Messrs. Mason and Dixon's surveying or of Mr. P. D. Gattson's.

WM. McROBERTS, JR.  
Baltimore.

MARIE LOUISE VIOLETS were received this week from the Anchorage Rose Co., Anchorage, Ky. They were certainly fine for this season of the year, when double violets are scarce, and were very fragrant.

## Florists' Supplies.

It is not so many years since florists' supplies consisted of broom straw, fine wire, toothpicks, moss, bouquet papers and tinfoil. But to-day it's different. The writer could not help thinking of the wonderful change as he wandered through the warehouse of Messrs. H. Bayersdorfer & Co., of Philadelphia. Here were baskets of every conceivable shape and form, constructed of all sorts of material, from soft pliable rush to harder willow, then celluloid and finally different metals plated with silver and gold, and if the search had been pursued further no doubt even the solid metal might have been found. Wheat sheaves there were without number.

"Where is the wheat grown"? we asked. "It all comes from Italy. It is cut before it is ripe, bleached in the field and then again by sulphur."

"This lot of boxes are full of wax flowers; these we sell to the natural flower preservers; we can give them any flower they want, and it does not take near as long to preserve natural flowers now as it used to."

"These willow plateaus are used as much as ever. They come from Austria where they are made by whole families at home, everybody from the oldest to the youngest performing their part. They make the same thing year in and year out and become very expert. Gypsy nest baskets are made in Germany in much the same way as the plateaus, all the family taking part. These gilt and silvered jardinières come from Berlin. There is a large and increasing demand for metal designs, and there is scarcely an emblem that is not included in this line."

"Do they seem to take the place of immortelles." "Not a bit. We sell more immortelles now than ever."

"Where are the immortelles grown?" "The best come from Toulon and neighboring country in France. Their natural color is yellow; the white are bleached and other colors dyed."

"Dried cyeas leaves are having a great sale; they resemble the fresh stock so closely that at distance of a few feet you can hardly tell them apart. They come from Germany, as do the dried latania, areca and phoenix leaves. Here are some phoenix plants, made up so true to nature that —." "No, I don't want to see them! Artificial flowers are bad enough, but plants never!" "Well, we sell lots of them anyhow."

"Which is the most popular pot cover?" "It's hard to say. The celluloid had a great run, and sell very well yet, and the plain willow and braid covers are popular with many, as they can be touched up with a little bronze when soiled and made like new. Here is a line of cheaper covers, paper-mache, good heavy material, well bronzed and silvered, this season's importation. They should become popular."

"Is there as much demand for cape flowers as ever?" "Yes, there are a great many capes used; it is astonishing where they all go to, but there is an immense quantity sold every season."

"Doves are still in great demand, being used largely by decorators as well as for designs. They are all mounted on stands now. They pack better and are easily detached when wanted."

"How about the hard times?" "Don't know anything about them. We are as busy as we can be and see no signs of a let down in business." K.

THE AMERICAN FLORIST and *Gardening* together to one address for \$1.75. Send orders to the American Florist Co.

## New Notes.

EVANSTON, ILL.—F. C. Fisher has started in the florist business here.

LONDONDERRY, PA.—Anna L. Seal has started in the florist business here.

MOSCOW, IDAHO.—W. D. Gano has sold out to O. P. Barkwill, who will continue the business.

AMITYVILLE, N. Y.—The Amityville Nursery and Greenhouse Co. is erecting a 100-foot greenhouse.

GRAND RAPIDS, MICH.—Henry Smith is succeeded by the Henry Smith Floral Co., J. W. Rawlinson, manager.

SOUTH BEND, IND.—Charles M. Treanor, of Treanor & Rettig, and Mabel M. Good were married September 27.

EVANSVILLE IND.—B. F. Kramer has finished building his greenhouse. This is his first season in the business.

ETNA, N. J.—Demarest Brothers have dissolved partnership. The business will be continued by J. C. Demarest.

CHESHIRE, CONN.—John J. Walter, late of New Haven, has moved his greenhouses and business to this place.

GARFIELD, N. J.—Miss Marie Lowe has started in the business here and will grow violets for the New York market.

TAUNTON, MASS.—C. A. Briggs has added five new houses, of which two are 20x100, two 8x100 and one 10x60.

DES MOINES, IA.—W. L. Morris has opened a down-town store at 306 Seventh street. He still retains his greenhouses on Cottage Grove avenue.

SPRINGFIELD, MASS.—At the last meeting of the Amateur Horticultural Society Mr. Chas. H. Barrows gave a valuable lecture on "Forest Preservation."

SIoux CITY, IA.—Edward Horning, formerly of Plymouth, Wis., has purchased the florist business of Wm. Smith. He will put the place in thorough repair and continue the business.

BURLINGTON, N. H.—The Board of Control of the Experiment Station has appointed Mr. A. C. Gulley, M. S., horticulturist of the station and instructor in horticulture at the Agricultural College. Mr. Gulley has been connected with the Michigan Agricultural College for some time.

THE HORTICULTURAL SCHEDULE of the Lyons (France) International Exposition, recently received, gives evidence of great thoroughness in this department. The horticultural exhibits are to be in place from April 26 to October 31, 1894, and are divided into 868 classes, including specimens and collections.

NASHVILLE, TENN.—Two of the florists here are indulging in wild competition and prices have been cut down way below cost. American Beauty roses have been offered at \$1 a dozen, other roses at 25 cents a dozen, valley and Romans 50 cents a dozen and carnations 35 cents a dozen in ads. in the daily papers. And since these announcements appeared one of the parties has sold American Beauties at 25 cents a dozen and all other roses at 10 cents a dozen. Of course the rest of us can do no business until this feud is settled by the failure of one or the other of the parties to it. It seems too bad that they can't fight their duel without doing such serious injury to the whole trade in this city.

LOUISVILLE, KY.—In a recent primary election, in the race for mayor, the men in favor of Mr. Jacobs wore a Marechal Niel rose, while those for Tyler wore anything else they chose, but principally red carnations. Anyone not in favor of Mr. Jacobs could not be hired to don a yellow rose. It originated by Mr. Jacobs always being seen with his favorite flower, an M. Niel bud, pinned to the lapel of his coat, and his adherents followed suit. I noticed in a recent issue of the FLORIST that this kind of floral badges was being worn in Vienna and suggesting its introduction into this country, and thought I would let you know that this plan is already in operation here.

## Foreign Notes.

Spiraea Bumalda "Anthony Waterer" is a dwarf variety having very deep rosy red flowers. It is an admirable thing for bordering shrubberies or planting in rockeries.

This year Mr. Eckford is testing eleven new sweet peas, not yet introduced to general cultivation. Among these is Blanche Burpee, wings and standards creamy white, very large; Countess of Aberdeen, white, delicately tinted towards the edge of the standard with soft pink, wings blush, very attractive; Novelty, orange tinted standard, wings delicate mauve, margined rose, very bright; Meteor, bright orange, tinted scarlet and violet; very distinct. Mr. Eckford is now working for a yellow flower, and it is quite possible that it will be attained in the future.

An additional list of M. Latour-Marillac's new hybrid nymphaeas includes N. Robinsoni, a small flower, barely four inches in diameter when open. Petals broad, soft rosy terra cotta, shaded with primrose, conspicuous golden stamens. N. Laydekeri fulgens, five outer dark green sepals, about fifteen cupped petals of deep crimson magenta. This is said to be extremely rich and glowing in color. N. Laydekeri lilacea is described as a small and dainty flower, with petals of a peach blossom color and rosy lustre. Like N. Laydekeri ignea, previously described in our pages, these are all great acquisitions to our list.

## Feeding Anthuriums and Alocasias.

In growing specimens does it improve anthuriums and alocasias to be watered occasionally with liquid manure? If so, should the liquid be very weak?

## ANTHURIUM.

Both anthuriums and alocasias will be benefited by an occasional watering with liquid manure during their season of active growth, that is, during the summer, providing they are well established plants. But during the winter it would be safer not to experiment in this direction, and at all times to use the liquid rather weak.

W. H. TAPLIN.

## Clematis.

A box of clematis flowers recently received from F. A. Baller, Bloomington, Ill., showed some excellent types, both in color and shape. One of the first noted was a seedling from Jackmanni, the color being a deep reddish purple; it is a fuller flower than the parent, having a tendency to come double. Jackmanni and J. superba were both noted; in the latter the flowers were in large clusters. Among less known sorts were some labelled as follows: Duchess of Edinburgh, a fine

double white, very pure and satiny; Countess Lovelace, a very large, six-petalled flower of clear violet, very striking. Fairy Queen, a large pale violet flower with deeper anthers; Princess Alexandra, fine purple of the Jackmanni type; Duke of Norfolk, purple flower, with white stamens and red anthers; Henry VII, large, white, very fine. These are among the most showy flowering vines we have, and are worthy of far more notice than we give them.

WE HAVE received from Messrs. Aug. Rolker & Sons, New York, samples of Fenster Pappe, a new German material for using on hotbed sash as a substitute for glass. The oiled material seems fully as transparent as the oiled muslin frequently used, but it is more rigid and we would imagine it to be a good thing.

WE HAVE received a copy of the premium list of the Toronto Gardeners' and Florists' Association for the fourth annual chrysanthemum show to be held in the Horticultural Pavilion, Toronto, Ont., Nov. 21 to 24 next. Copies may be had on application to A. H. Ewing, Sec'y, 85 Carlton street, Toronto, Ont.

## SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

SITUATION WANTED—By an experienced florist and gardener who wishes to change place by December 1. Best of references. State wages. Address B. N. care American Florist, Chicago.

SITUATION WANTED—By single man to assist on private place; English; 5 years experience. Good references. Age 21 years. Address WILLIAM M. TIDLADY, care J. C. Vaughan, P. O. Box 688, Chicago.

SITUATION WANTED—By a thorough, practical gardener and florist, care of gentleman's private or commercial place. Roses, carnations, violets a specialty. Best references. Address G. W. box 88, Brooklyn Village, Ohio.

SITUATION WANTED—As travelling salesman for seeds, plants, bulbs, etc. Am at present holding a like position; will be disengaged November 1st. State salary. Address SALESMAN, care F. Stevens, Chaymont, Delaware.

WANTED—One Carnaby boiler, second-hand, must be good and cheap. WM. GERLACH, Piqua, O.

WANTED—A first-class make-up and salesman at once; permanent place to right party. Address J. J. M. care American Florist, Chicago.

WANTED—A rapid and reliable packer of green house plants for the catalogue mail and express trade, about January 1st or sooner. Address with full particulars. WESTERN, care American Florist.

WANTED—A good, honest, energetic, single man, with some experience in growing plants and cut flowers, to take charge, at once, of floral business in town of 10,000. FLORIST, box 15, Columbia, Tenn.

WANTED—First-class man as market gardener, rose grower and propagator, must be experienced and active and able to take charge of part commercial place; German; single preferred. Wages, \$5 per month and board. SCHMALZ & HUBER, Marysville, Marshall Co., Kan.

FOR SALE CHEAP—The very handsome oak finished and plate glass ice box, shown in our exhibit at the World's Fair. Visiting florists in need of a fine box will please examine this. VAUGHAN'S SEED STORE, Chicago.

## FOR SALE OR RENT.

Rose and cut flower growing plant containing about 35,000 square feet of glass; houses heated by steam and hot water; all in good condition; well stocked with roses, ferns, palms, etc. Only 15 minutes ride from center of city. If you mean business, address FLORIST, care Chas. E. Prather, Louisville, Ky.

## WILL EXCHANGE.

L. Cand. Iberis semp. Astilbe jap. Freziera, Grape Myrtles, Caladium esculentum, Grevillea robusta, Clematis Davidsoni, Pontederica, Canina Star of 31, Tecoma radicans, Sarcocolla purpurea and nana, Dibe, White Aithyas, and other shrubs, Eulalia uni. and Amaryllis Treatii, for usable plants, etc. What have you? The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

SWEET PEAS of the best named sorts appear to be a short crop.

VISITED CHICAGO, Z. De Forest Ely, L. L. May, C. A. Reeser, W. Wendell, Avery Gallup, S. M. Emery, H. A. Johns, H. H. Friedly, Dan'l DeCou, F. T. Emerson, L. L. May.

Seedsman Meet—The American Protective League Dines and Does Business at the Rochester Club.

At the Rochester Club yesterday afternoon was held the annual meeting and banquet of the American Seedsman's Protective League. Dinner was served at 1 o'clock. The menu was very carefully selected and the table was one of the finest ever set in this fashionable club house. The centerpiece was made of vegetables of various kinds furnished by Crosman Bros. and arranged by the steward in a most attractive design. There were potatoes, cauliflower heads and other seed products, all set off by flowers.

After dinner the business session was called to order. The members present included W. Atlee Burpee, William Henry Maule, Wm. F. Dreer, Robert Buist, Landreth & Sons, all of Philadelphia; Alexander Forbes, of Peter Henderson & Co., New York; James Bruggerhoff, of James Thorburn Co., New York; N. B. Keeney, of Le Roy; C. W. and George F. Crosman, of Crosman Bros., and James and Charles H. Vick, of James Vick's Sons, of this city. —Rochester Herald, October 11.

Louisville, Ky.

The leading florists of the city are now preparing for the annual flower show, which will take place at Liederkrantz Hall early next month. This display will be gotten up for the benefit of the children's free hospital and will be under the auspices of the Hospital Circle of King's Daughters. Among those who have agreed to make exhibits are Nanz & Neuner, Lauer, Schulz, Reimers and others.

Edw. G. Reimers has just completed four very large greenhouses of the latest improved style, which contain about 25,000 feet of glass.

Jacob Schulz has bought Francis Morat's Sons' store on 4th avenue, the Messrs. Morat retiring from the business.

A. Lauer, one of Louisville's oldest florists, is confined to his bed by illness.

Warm weather makes trade quiet, market overstocked. Stock is getting in good condition and fine La France roses are taking the lead.

## Indianapolis.

The October meeting of the Indianapolis Florists' Club was the best attended meeting ever held and several new members were elected. A paper on "Public Parks" was read by Herman Young, florist at Garfield Park. The subject was well handled and was discussed at some length. Another paper by John Hartje on "Soils" was short, but showed knowledge and experience.

A committee was appointed to represent the club on the reception committee for the chrysanthemum show. Show matters were reported progressing splendidly. Chrysanthemum plants and flowers are in excellent shape in this neighborhood.

The Indiana Horticultural Society will make an exhibit of fruits to be in position Wednesday noon of show week in connection with the chrysanthemum show. This society meets in annual session at the State House November 8, 9 and 10.

Trade has been dull, but is improving at intervals.

Referring to our article on bulbs sent to a local seed house here, as appeared in FLORIST of October 5, we find upon further investigation that there was just cause for the party refusing them, and no reflection should be cast against his credit on account of this transaction.

The first chrysanthemum blooms of this season were displayed in the florists' windows here October 13. The variety displayed was Mrs. E. G. Hill, a seedling cultivated by E. G. Hill & Co., Richmond, Ind. The dozen blooms shown were on straight stems thirty inches long, covered with perfect leaves from base to flowers. The flowers were about half expanded and showed a beautiful shade of pink, shading from La France to Day-break pink; it is an incurved variety with perfect shaped petals, the outer edge of flower opening somewhat circular. The display attracted all passersby and was admired greatly. It is certainly an early variety, the most pleasing color and good texture. No matter who says that chrysanthemums are big coarse flowers, they will admit now that no flower has grown more in favor among all classes of people than the Queen of Autumn.

W. B.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

The Grand New Forcing Rose,  
*"American Belle."*

Send for Circular.

## Carnations.

Only a few field-grown plants remaining. Good plants and good kinds.

**C. J. PENNOCK,**  
THE PINES, KENNETT SQUARE, Chester Co., PA.

St. Paul, Minn.

Fall trade is opening up poorly, "hard times" being at the bottom of it. Dry weather and killing frosts took care of all outside flowers some three weeks since. Florists depend mainly on funeral work at present, but we hope soon to see a brightening trade.

Some of the department stores here and in Minneapolis have "flower days," selling at wholesale prices; it tends to dispose of the surplus while not materially affecting the regular retail trade.

Roses and carnations are about the only flowers now being cut. Tuberoses are not grown to any great extent. They never thrive successfully as an outdoor flower in this latitude, while the low prices at which they sell do not warrant their being grown inside.

There is an ever increasing demand in this city for "house plants" and rarely if ever do our florists have a surplus that cannot be disposed of. Ten years ago two or three small greenhouses supplied the entire trade in cut flowers and plants; now there are a score or more, some of them like May's containing upwards of 100,000 square feet of glass. And still their capacity is taxed to the utmost.

The city owns greenhouses of its own made of iron and glass, very substantial, they being under the direct control and supervision of Mr. Mussbaumer, superintendent of parks. All bedding plants for the parks are grown there and the fine effect produced in the bedding in the city parks this summer was a revelation to many, the display at Como being especially notable.

Coal bills are an all important and expensive item of the florists. Nearly all here use a Mansfield or Yonghegheny grade for steam heating, which seems to be used more than hot water. Last winter was an exceptionally long and severe one and had it not been for the unusually good trade that followed in the spring some of our brethren would have been stranded.

Carnations are all planted in benches, likewise violets. Roses are coming on in fine shape, though damp, cloudy weather of late has retarded them somewhat. Chrysanthemums are in excellent condition and the first will be in in a few days. No chrysanthemum show has been announced and the committee who have the matter in charge will most likely recommend that none be held. FELIX.

## PANSIES.

Best mixture of Geranian bedding varieties now ready, per 1000 \$5.00; per 100 60c.

We have also separate colors, ready in two weeks.

**BRAUER & RICHTER,**

## Baltimore.

The club has become a bird of passage in its flights from one home to another, but each change seems to be for the better. The last meeting was held in the richly decorated and exceedingly comfortable hall of the Royal Arcanum building, Saratoga, opposite Liberty street. The largest attendance in many moons was there, and all seemed perfectly satisfied with the quiet and elegance of the new home. Let us hope for no more changes until we change into a building of our own.

A question referred back to the club by the exhibition committee was the cause of a very animated and somewhat acrimonious debate. It was "shall holders of sale booths at the show be permitted to sell flowers grown outside the state?" From the bitter character of some of the remarks it seems as if this old and vexed question of selling will never be settled until we adopt the scheme proposed by a member a long time ago, viz.: Have a limited number of sale booths and sell the right at auction to use them for selling any cut flowers or plants during the exhibition.

The question box developed quite a number of interesting questions as usual. "What makes water blow out of greenhouse pipes?" was answered by Mr. Ekas, who declared that "if piping were properly put in water could never blow out of the expansion tank." Several members differed from him, so the question was not decided.

Chrysanthemums are appearing here and there in the store windows. Violets are also to be had in small quantities. Cosmos and dahlias are in in unlimited quantities and at unlimited prices as far as cheapness goes. Perles and La France are plentiful at three cents.

Mr. Henry Wiedey is building a greenhouse on the York Road near the city limits.

Our librarian, Mr. P. Welch, is not saying much, but his "mums" will talk for him by and by. The long desired rain has come at last and

A little bird had it the other day that Mr. John Donn is going to hold a big chrysanthemum show of his own at Lakeside Park. MACK.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

## Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

RICHMOND, INDIANA.

Toronto.

Business has brightened up considerably during the last few days, although the weather has not changed much and is still mild and balmy at this date (14th). This appears to be a particularly favorable time of year for dying and getting married, and "it is an ill wind that blows nobody any good."

I wish to draw the attention of those interested to an error in the prize list of the chrysanthemum show to be held here from November 21 to 24. The mistake occurs in regulation 4, in which "November 7" should read *November 21*. The date of the show was changed, but this seems to have escaped the eagle eye of the secretary.

The weather having been so fine this fall chrysanthemums are getting ahead rapidly and already some few flowers are to be seen. It is to be feared that many of the early sorts will be over before the show if it keeps so mild much longer, as it is impossible to hold them back even with all ventilators open, but there is no fear but that there will be any amount of flowers and plants just in right order for showing even as late as November 21. It has always been remarked at former shows that if it had only been a week or two later such and such a sort would have been in better trim and Mr. So and So could have made a better show.

At a meeting of the combined chrysanthemum and executive committees of the G. and F. Association the other night all the necessary arrangements as to advertising, decoration, band, flower booth, superintendent, judges, price of admission, etc., were decided on.

Everyone who has not already been there is making tracks for the World's Fair now. E.

FROM ALL SECTIONS come reports of an unusually large crop of chrysanthemums of fine quality, and the exhibitions of 1893 will be unusually attractive. The improvement in the chrysanthemum during the past few years has been really wonderful and the final culmination seems not yet at hand. For years it has been predicted that the "chrysanthemum craze" was near its end, but up to date it is still growing and expanding. And we are inclined to believe that better cultural methods—more thorough understanding of the requirements of the plant—have assisted more than is generally supposed in bringing the flower to its present state of excellence. The fine new varieties would not be what they are if improvement in methods of culture had not kept step with the advances in other directions.

## The World's Fair Chrysanthemum Show.

Our announcement in last issue is already bearing fruit, and from all points come assurances of assistance in making this exhibition what it should and must be. Cincinnati, Buffalo and Detroit will have no exhibitions this year and word has already been received that each of these cities will send a carload or more of exhibition plants and flowers to the World's Fair show. Growers around New York, Philadelphia and Boston have telegraphed Director Craig assurances of entries from those sections, and that the display will be a memorable one seems already assured. We hope to see every grower of exhibition plants and flowers

represented and every introducer of new varieties here with his pets. An award of a medal and diploma to a new variety at this exhibition will mean a great deal, and the happy winner of such can offer his variety to the trade and the general public with the seal of approval of the best posted and most conscientious judges in America, and in a competition in which all the best growers will be represented.

Following is the premium list. Extra copies, in pamphlet form, and entry blanks and any further information desired, may be had on application to W. C. Egan, Sec'y, Horticultural Building, World's Fair, Chicago.

## PREMIUMS.

All plants and flowers included in Sections I, II, III, IV and V must be in position for judges to pass upon by 11.30 a. m., opening day, November 4, 1893.

### CUT FLOWERS—CHRYSANTHEMUMS.

All flowers must be exhibited on stems not less than twelve inches long and without artificial support.

The World's Fair.

Chrysanthemums are the most interesting feature at present, and there are some interesting varieties in bloom. Mme. Bergman was the first white to open, Firenze the first yellow. Whildin and Gloriosum are now in good bloom, closely followed by Lincoln and Gorgeous. Domination has suffered a great deal from the ravages of the tarnished plant bug (*Lygus pratensis*), an insect described by Mr. E. D. Smith in the *FLORIST* for September 28. Many strong shoots are nothing but a thick bunch of blind wood at the tip, and the plants have had to be cut back recklessly in the hope of getting some flowering shoots. We often see distorted flowers, which are the result of this insect's attack on the young buds. Another trouble experienced has been with a root disease, apparently, causing loss of leaves; Vivian-Morel appears to have suffered more from this than any other variety.

Among dark varieties Alberic Lunden, George W. Childs, John Thorpe and Mrs. A. J. Drexel were the most noticeable. The rich carmine red and well shaped flower of Lunden make it a very taking variety. Mme. L. Langlois, reflexed flower, pink, shading to lemon in the center, was very handsome, and Salvator, a beautiful terra cotta flat reflexed flower, was noticeable for its fine color. Joseph H. White, one of the good early whites, made a nice pot plant. Ed. Hatch was not yet open, nor Mrs. Gov. Fisher, though the broad ribbon-like petals of the last named were beginning to uncurl. Redondo, a bronze with reverse of petals old gold, a very showy flower, claimed admiration; the color is very warm, and it is earlier than many of its tint.

In the hairy section Louis Boehmer was opening its flowers; pity its color is not more desirable, for it has so much more constitution than Mrs. Hardy. In the bench of new seedlings originated at the Fair there is a hairy petalled white one; it is not yet sufficiently expanded to see what the flower will be like, but the growth is very robust. Several of the late seedlings show great vigor and very promising foliage, but a number of them have suffered severely from the tarnished plant bug. A batch of strong growing seedlings will be viewed with particular interest; they were fertilized with our native *Aster grandiflorus*, which, if the cross was successful, might give us some extraordinary results in the way of color. But so far one can not find the slightest trace of aster parentage in the seedlings, in foliage or habit; the flowers, however, are not yet sufficiently advanced to show color. Such a cross as this might, some day, give us the blue chrysanthemum whose possibility is often discussed.

A group of three large plants, Puritan, in one of the houses, makes an interesting display of fancy training. There is a huge fan, probably eight feet across at base, a tall standard trained in umbrella shape, and another plant spread out into a large circle a few inches above the pot. These plants are all coming on nicely, and no doubt they will take the eye of many at the big flower show. There is quite a number of standards, but no collection of plants grown to single stem. Most of them are left in hush form. The chrysanthemums are kept locked up until the time for moving them into the big building, owing to the fondness of some of the visitors for floral souvenirs and "slips."

A collection of tuberous begonia blooms, from the Oasis Nursery Co., received in time for New York day, were of remarkable size and beauty; some of the single

Medal Day, Tuesday, November 7th.

All flowers sent for competition or exhibition on this day will promptly and carefully staged by James Dean and Frederick Kanst. Parties who are unable to be present and who desire to enter are assured that their exhibits will receive special care.

SECTION VI.

SEEDLINGS—CHRYSANTHEMUMS.

All seedlings, varieties not disseminated, shown for competition must have at least six flowers of each variety and be shown on long stems without any artificial support, and no award will be made to any specimens unless an improvement on existing varieties now in commerce.

ones were over six inches across. Mr. Hill's new pink chrysanthemum, and a new yellow seedling from I. N. Kramer, Cedar Rapids, Iowa, were also on exhibition, and the Cushman Gladiolus Co. keep up their display of cut gladioli. The single dahlias are generally looking very well, and if we do not have very sharp frosts during the next week or ten days there will be a great abundance of bloom.

A fine feature of Manhattan Day was the display made by the New York Florists' Club, which was fully worthy the dignity of the Empire State. It was arranged in the northeast corner of the dome and consisted of cut flowers in great variety. One of the first things to be noted was the quantity of tuberous begonia blooms, laid flat upon a background of ferns and other foliage, entirely covering some of the tables and forming gorgeous borders to others. The flowers were simply magnificent in size and color, and the effect, arranged in blocks of color, yellow, scarlet, crimson or salmon, was superb and the object of universal admiration. All along the wall, on two sides of the triangular space occupied, the tables bore vases of roses, Beauties, Mermets, Perles, Brides, Mc-teers and Wattevelles of fine quality and arranged for effect. Chrysanthemums, yellow, white and pink, occupied other tables, with a large vase of the new Mrs. E. G. Hill in the center. Lily of the valley and mignonette of fine quality added their perfume to the roses, while smilax and garlands of passion flower decorated the wall. Too much praise can hardly be given to the members of the Florists' Club for the generosity with which they sent their flowers on this occasion, and the tasteful manner in which they were displayed must also be noted. It must also be stated, to the honor of the New York florists, that they are the only members of our craft who have made an organized effort to give displays of cut flowers at the Fair.

The New York state building was naturally in gala attire on this occasion, heavy garlands of oak leaves being used, twined about the columns and draped over the face of the structure. Inside the stately rooms were garlanded with the same material, with decorative plants here and there. At the breakfast to the Old Guard the table was decorated with red and yellow tuberous begonia blooms, laid over foliage flat upon the table. Similar flowers were used on the dinner table. In the evening the cut flower display was moved from the Horticultural Building over to the state building. When the Old Guard was passing the Horticultural Building they received a volley of flowers from New York, an attention that was much appreciated.

Overhanging Trees.

In "Wood on Nuisances" it is said: "Trees whose branches extend over the land of another are not nuisances, except to the extent to which the branches overhang the adjoining land. To that extent they are nuisances, and the person over whose land they extend may cut them off, or have his action for damages, and an abatement of the nuisance, against the owner or occupant of the land on which they grow, but he may not cut down the tree. Neither can he cut the branches thereof, beyond the extent to which they overhang his soil."

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

DO YOU WANT an alphabetical list of the chrysanthemums in commerce in America, with class and a brief accurate description of each one, and synonyms noted? You will find such a list in our trade directory and reference book.

THE AMERICAN FLORIST and Gardening together to one address for \$1.75. Send orders to the American Florist Co.

WHEN SENDING us newspapers containing items you wish us to note please do not fail to distinctly mark the item so it can be easily found, as we can not spare the time to hunt through the mass of papers sent us for unmarked items.

YOU CAN'T AFFORD to do business without a copy of our trade directory and reference book.

## Carnation Notes.

Carnations are now beginning to make a crop and a little talk on the pulling and packing of them may not prove amiss, at least to beginners. Some who are not beginners have much to learn on this subject, among them myself. If some commission man who receives stock from a number of growers would give his views on the proper packing of them it would prove very interesting reading for us growers.

In pulling a long stem carnation it is well to pull it LONG, with the buds and if necessary some of the foliage with it. The difference in the number of blooms you get from a plant by this method is not as great as you would at first sight think. The plants will keep pushing along much faster and make better flowers than if you try to save some of the lateral buds, which do not make a first-class flower anyhow. There is a difference among growers as to what constitutes a long stem carnation, some holding that five inches should be classed as long, others that nothing less than eight inches should belong among the long stems. I am of the latter opinion, and think from eight to twenty is about right.

A few weeks ago I noticed an article, saying that we growers were making the express companies rich by paying them for carrying a lot of buds on our carnation stems. Whether the idea was to get us to disbud on the plants or not I do not know, but I always thought that the buds added to rather than detracted from the beauty of a bunch of bloom.

Another important point, is not to pull them until they are fully open, they carry much better, keep better, and sell better if allowed to open well before pulling. Where it is practical a good plan is to go over your houses every day and pull all the flowers that are well opened. Where the flowers are not used or shipped every day they are however better on the plants excepting a few varieties. Among the varieties I grow, Daybreak and Fred. Dorner are pulled daily and put in water until ready to ship. After the days get shorter and the sun is not quite so hot and bright this will not be necessary, but now they will fade off if left to get a day or two old, not enough to seriously hurt them, but just enough to spoil their beauty. There is only one time of the day to cut them, and that is before 9 o'clock in the morning. Some prefer putting them in water a few hours before packing, others pack them direct as they are cut. Both plans seem to give satisfaction.

The usual plan is to tie twenty-five in a bunch; some put in fifty, but that makes rather too large a bunch for convenient handling. Keep the stems even at the bottom, this will throw the flowers in an irregular bunch and they can be packed to much better advantage. A good plan is to put them in singly in the same way as roses are packed, putting 100 in a layer and dividing the layers with tissue paper. After you have the box packed put a memoranda of the contents in the top; this takes but a minute and is a great help to the party getting them.

GENERAL VIEW OF THE DISPLAY OF CANNAS AT THE WORLD'S FAIR.

The box will have to be lined according to the weather. Now a single piece of tissue paper will answer, as it gets colder use some newspaper around the sides, and when it gets real cold use newspaper, cotton wadding and tissue paper according to the cold and distance of transportation. Mark your boxes plainly with marking ink. Cards and stickers with the address put on with pen and ink are a poor affair. Put the red leaf cut flower label on the top, ends and sides of the box, and in short do everything you can to facilitate the handling of your flowers, leaving no opportunity for the express companies to mistake the contents and the destination of the box. Get your express agent to show you his latest instructions in regard to the handling of cut flowers, and insist on his following them to the letter. A few courtesies, such as an occasional bunch of nice flowers or a little sociability on your part will always be appreciated by him, and your interests looked after much better than if you start in to bulldoze and abuse him.

After you have attended to all this you will sometimes have a loss, and then you can follow Sam Weller's example and keep a cheerful countenance and a jolly heart, for there are ups and downs in all businesses and this is no exception to the rule.

A. M. HERR.

#### Notes by the Way.

*Lilium nepalense* at the F. L. Ames' place is one of the striking sights which Mr. Robinson has to show visitors at present. It has a very beautiful bell shaped flower, outside yellow and inside deep velvety purple shading to yellow at the margins of the petals. Although not a recent introduction this is the first time the writer has seen it in flower here, and it is so beautiful as almost to eclipse the gorgeous orchids now in bloom in the houses alongside. The recent death of Mr. Ames has naturally cast a gloom over the magnificent estate, and no one feels his absence more keenly than Mr. Robinson, who has been his gardener for so many years and who had such opportunities for becoming acquainted with his employer's rare and noble character.

Twenty years is a long time to be working among carnations, and one would suppose a good deal might be learned in that time. Mr. Sewall Fisher, however, with the rare modesty which betokens the true enthusiast, would have us believe that he knows nothing at all, notwithstanding that he has given us Mrs. Fisher and several other very fine varieties. What he means probably is that he knows nothing in comparison to what he doesn't know about the raising of new carnations. Any one who has listened to the cock-sure, know-it-all harangues of some of those who have been

raising the Divine flower for a short year or two would find a fine antidote in a half hour's talk with Mr. Fisher. He has quite a number of promising seedlings on trial at present, but none ready to disseminate this season. All his seedlings are thoroughly tested several years before being sent out. This conservative course accounts for the number of varieties sent out by Mr. Fisher which have become standard sorts. A yellow seedling among a batch of six yellow sorts looked to be a fine thing, and Mr. Fisher admitted that it was the most promising yellow he had yet got, but said it was too soon to get enthusiastic. Next year and the year after might tell a different story. A very fine crimson, larger and better than Anna Webb, was noted. It is in its second year and will probably be heard from later. Mr. Fisher has been crossing with Marguerite on Florence and others and some unique results are looked for in this direction. Wm. Scott, among the pink sorts of recent introduction, is very highly spoken of, which is something of a compliment coming from so conservative a source.

Fred Mathieson and Tom Cox have two of the cleanest and tidiest places around Boston. It does one good to walk through them. Tom has a good eye for a fast horse too. It is a great sight to see Jim Rough and Tom at a 2:40 canter across the Cambridge bridge. Mr. Rough's black can put on a 2:30

gait when necessary, they say, but Tom swears that his pony can knock the stuffing out of Jim's in a twenty mile run. When the horse talk is on it is pretty exhilarating to be a listener outside Mr. Rough's counter. But when it comes to putting these strong assertions to the test and one has the privilege of sitting beside the driver the experience is more than exhilarating; it is terrific!

Lawrence Cotter's chrysanthemums are like his roses—extra fine—this season. Lawrence has tried a new wrinkle for making his plants dwarf with good success. Book learning is not despised here, and this imported method is one of the benefits resulting therefrom.

Mr. Wm. J. Stewart has been so much identified with the wholesale business that most people wonder where he gets all his information about trees and shrubs and plants in general. A recent visit to Mr. Stewart's charming home in Winchester partly cleared up the mystery, for here was seen a fine collection of conifers, shrubs and other plants, nearly every one of which was a rarity in its class. One specimen, a *Pinus ponderosa pendula*, a fine healthy young plant, is claimed to be one of the rarest pines in cultivation. The famous Blue Spruce of Colorado is well represented, as are also various rare thuyas, piceas, etc. It would take up a good many columns of the *FLORIST* to tell of all the rarities which Mr. Stewart has collected here in the course of the past fifteen years. He loves every specimen for itself and takes the greatest delight in watching their development. It was quite refreshing to find this heretofore unsuspected phase of a wonderfully versatile character in other directions.

Great improvements are noticeable at the Arnold Arboretum. New ground is being broken in and planted out; new driveways are being made and the immense collection of trees and shrubs is yearly growing larger. Mr. Dawson, ever genial and enthusiastic, seems to get more mellowed as the years roll by and his family grows larger. The arboretum is the first place one ought to take in when visiting Boston. There is always something interesting to be seen, spring, summer, autumn and winter; besides there is the surety of a warm welcome from a big hearted man who is a walking encyclopedia of information.

G. C. WATSON.

#### A Visit to Hinsdale, Ill.

On the 14th inst. Mr. John H. Taylor, Bayside, N. Y., paid a visit to the establishment of Mr. O. P. Bassett, at Hinsdale, Ill. He was accompanied by the scribe, who made some notes of the conversation between these two well known growers as follows:

Mr. T.—"You seem to have a good many Harrisii."

Mr. B.—"Yes, I have a total of 30,000. I handle them so as to bring them in in small lots through the season. Will begin cutting flowers about November 15 to 20 and will have them till the end of next July."

Mr. T.—"I see you have a batch of Meteor. How do you like it?"

Mr. B.—"Well, we can't grow it the way you do cast, but we find it very useful."

Mr. T.—"Probably you don't give it enough heat. It needs a higher temperature than most other roses."

Mr. B.—"Thanks for the pointer. Will give mine more heat as you suggest and note results."

Mr. T.—"You have a lot of Beauties and they are in fine condition too."

Mr. B.—"Yes, I have 10 houses of Beauties, each house 20x170. We grow more Beauties than anything else. By the way, I will tell you a good story about this house. It was planted last May with rooted cuttings taken from the sand bed and which had never been even potted off. When planted they were so small you could hardly sight the rows, and now as you see it is the best house of Beauties I have."

Mr. T.—"I have done the same thing with Hoste and had equally good success. I notice a few blind shoots on some of the Beauties. I don't grow the Beauty myself, but growers in the east say that every blind shoot can be made to produce a flower by bending it down, carrying it along to the next stake and tying it up to that. The extension of the cane seems to produce the result. How do you like Hoste?"

Mr. B.—"Not very well. I can't get good flowers till late in the season—till real cold weather."

Mr. T.—"Now, I consider it one of the best roses I grow. It does exceedingly well with me. Testout is also a grand thing with me. But to get plenty of good flowers you must cut it down each time to one or two eyes only. It will keep on coming as fast as you cut it down. I see you are trying some Kaiserin."

Mr. B.—"Yes, it seems to be a good summer rose, but am afraid it won't be of much value for winter work."

Mr. T.—"I have found it equally valuable for winter flowers and consider it a good all round rose. I see your new range of houses are built on the short-span-to-the-south principle. How do you like it?"

Mr. B.—"Well, to tell the truth I can't see as it makes much difference which way they are placed. Still, during the summer these houses are certainly cooler than the others and that is a point. No, am sure there will be no trouble from snow laying between the houses. I watched Mr. Miller's range, near here, last winter and though they are joined together, and with the same angles, he never had any trouble, and we had more snow last winter than for many years."

Mr. T.—"About what was the cost per running foot of these new houses, including heating?"

Mr. B.—"I haven't figured it out exactly, but as a close guess I should say about \$12 a running foot."

Mr. T.—"Why, that's almost as much as my iron frame houses cost. They cost me \$12 a running foot exclusive of heating."

Mr. B.—"Well, the way these are built they will last about as long as an iron frame house. And by the way I must tell you that in only six weeks from the time the ground was broken for this new range of 11 houses, each 20x170, the planting was completed, all the work of construction, painting, piping, etc., having been done in that time."

Mr. T.—"It certainly was a very quick job. You seem to have had a fire here."

Mr. B.—"Yes, and it was a quick one too. This was our old boiler house. We use crude oil for fuel and the building, which was of frame construction, was pretty well saturated with the oil. We had just set down to dinner and the soup had been served when the kitchen girl called out that the greenhouses were on fire. We ran out to do what we could, which was simply to confine the fire to

the boiler house and keep it from spreading. The whole thing was over so quickly that when we went back to the table the soup was still warm and our dinner was not spoiled. Over here is our new boiler house which is as you see of brick and a pretty solid affair. We still use crude oil for fuel and would not return to coal. See how easily a fire is started. Now come around to the rear of the boiler and look in at the flame through this ising-glass set in the brick work."

Mr. T.—"That is quick work and a powerful fire. Where do you store your oil?"

Mr. B.—"In this tank sunk in the ground out here. It is fed to the boiler by this pump, and mixed with steam from this small boiler before it goes to the burner. As you see we have no offensive odor from the oil and outside of the boiler house you can not detect any smell. We haul the oil from the depot in that tank wagon you see over there. But come in here; I want to show you some valley we are forcing. It seems to me to be coming pretty good for this season of the year. I bought the pips from cold storage."

Mr. T.—"Well, I should say they were good. I never saw them better at any season of the year. And by the way I never saw American Beauties average finer than yours. In teas you are not quite up to our best eastern growers, but none of them are ahead of you on Beauties."

#### Chrysanthemum Shows.

Toronto, Ont., Nov. 21-24—Toronto Gardeners' and Florists' Association. A. H. Ewing, Sec'y, 85 Carlton St.

WE HAVE RECEIVED from Mr. R. Witterstatter, Sedamsville, O., a half dozen blooms of his new early pink chrysanthemum, *Rosa Kupferle*, which is certainly a very handsome thing and will surely be useful. The flowers were large, slightly reflexed, much like *Viviani-Morel* in size and form, and held at a short distance the color was a clear bright pink of a very attractive shade. Close examination showed that the color was unevenly distributed on the petals and that there was a strong trace of magenta in it, but

BED OF ALPHONSE BOUVIER CANNAS AT THE WORLD'S FAIR.

held at arm's length this last was not perceptible and then the effect was superb. Several ladies who inspected the blooms were charmed with them, and we believe the flowers would probably sell better over the counter than some others which have a better finish. In view of its earliness and fine general effect we are inclined to believe this variety will be very useful.

#### Gardenias.

The gardenia is much grown in England as a florists' flower, and is becoming to a certain extent popular here in the same capacity. On account of its deliciously fragrant flowers it is a desirable greenhouse plant, and as it is of a hardy constitution it stands well as a window plant. All the gardenias are sweet scented, and all of them, with the exception of *G. Standleyana*, are pure white flowers. They are easily propagated from cuttings made from the half ripened wood, using a moderate amount of bottom heat, and inserted in a moderately close propagating frame. The young plants do well planted out for the first summer if you have a piece of wet sandy land to plant them out in; if planted out in a dry place they get spidery and starved. They should be grown in a mixture of loam and peat in equal parts with some sand and a small amount of well decomposed manure, giving them plenty of drainage. When growing give plenty of water and liberal syringings or else they get infested with spider and thrips. While they are growing keep them warm, and when the growth is

completed keep cooler and not so moist to ripen the wood. After flowering they should be pruned back a little to induce them to make bushy shapely plants. Repot them if they need it, and start them into growth for another season's flowering.

*G. florida* is a strong growing variety with bright glossy green leaves, rather upright growth and large white flowers. This variety stands cutting well. *G. citriodora* is a very fragrant species, free flowering; the flowers being about the size of orange blossoms and produced from the axils of the leaves. This variety is of a compact spreading habit and grows about two feet high. *G. Fortunei* is a very strong growing variety, very free blooming, and the flowers are very large; it much resembles a large form of *G. florida*, but is a much freer bloomer. *G. radicans* is a small foliaged dwarf growing variety, and very free flowering; a very desirable pot plant. *G. radicans major* is a stronger and larger variety than *radicans*, though not so large as *G. florida*; it is the most profuse bloomer of all the gardenias. *G. florida variegata* is a variegated form of *G. florida*. The leaves are margined with yellow, making it a handsome plant when not in flower. *G. radicans variegata*, a variegated form of *G. radicans*, has the leaves margined with white. It is a very pretty little plant and as free flowering as *G. radicans*. *G. Standleyana*: This variety produces immense flowers, trumpet shaped, from eight to ten inches long and five inches broad, the throat and base of the lobes of the flowers spotted and blotched with

reddish brown, and the margins are white. This variety is very fragrant. It is a free grower and blooms in summer, but as it is a native of Sierra Leone it requires more heat than the other species, which are all, with the exception of *G. citriodora*, natives of China and Japan.

Madison, N. J.

JAS. S. TAPLIN.

#### Foreign Notes.

*Cypripedium Charlesworthi* is a very distinct variety of recent introduction, which received a first class certificate from the Royal Horticultural Society. It is very dwarf, with long narrow leaves, flower stem only three to four inches long. The lip is short, green, suffused with brown, stamens pure white, dorsal sepal very noticeable, broad and round, of a delicate rose color.

*Nepenthes mixta* is a cross between *N. Curtisi* and *N. Northiana*, recently exhibited in England. The pitchers are nine or ten inches in length, rather narrow, and in color greenish red heavily blotched with brownish red. The ribs surrounding the mouth of the pitcher are deep crimson.

*Disa premier* is a new hybrid obtained by crossing *D. Veitchii* with *D. tripetaloides*. It has bright rose red flowers, and obtained a first class certificate from the Royal Horticultural Society recently. It was flowered at the Royal Gardens, Kew.

## A Palm Leaf Blight.

The caryotas are among the most attractive of our palms grown for indoor decoration, and it was with many regrets that recently the writer saw a score or more young plants with their leaves badly blighted. The accompanying engraving will give the reader an idea of the general appearance of the pair of leaflets that are badly affected. Near the center of each is a large long ashy spot, shown natural size in the engraving. This light area is bordered by a brown, almost chestnut shore, while over the central portion are many small specks seen with ease only with the hand lens. These are sporespots and consist of rifts in the skin of the leaf through which the fungus protrudes and bears its multitudes of spores.

It would be interesting to study the development of these blighted patches and determine whether some injury is needed to so weaken the tissue as to permit the fungus to get a foot hold. However this may be it seems true that when once within it is able to grow, extend and finally ruin the leaf.

One of the surprising features of this blight is the quite uniform location of the single spot near the center of the leaf.

As for a remedy, there is perhaps nothing better than the cutting away of these blighted leaves and burning them. A leaf that has its center killed as has the one shown in the engraving can only become worse as time goes on.

The fungus found associated with these spots, whether the cause or secondary to some injury, as sun scald or the like, is a species of anthracnose that if the cause would doubtless be amenable to treatment like a similar fungus upon the carnations. BYRON D. HALSTED.

Rutgers College, October 6, 1893.

## New York.

There is little, if any, improvement to be noted in the condition of the flower market. The stagnation still continues, and there is more stock of all kinds than can be handled to advantage. Among chrysanthemums the varieties most abundant at present are Ivory, Mrs. J. G. Whilldin and Mrs. J. N. Gerard. Ivory is decidedly the best seller, and is likely to be until Minnie Wanamaker can be had in quantity. A good early pink one to supplant Gerard is wanted. This variety drops so quickly as to be of little value for shipping, and is very unsatisfactory to handle on account of this pronounced defect. Violets are very plenty and seem to be free from disease than for several years past. They are overstocked and it looks as though the high prices of last year would scarcely be reached this year.

The wedding decoration for Miss Neymann's wedding at St. George's Church on October 24, by Warendorff, of Broadway, was a little out of the common run. Oak boughs formed a large part of the decoration in the church. The beautiful polished foliage with its rich autumn tints in deep red and mahogany was very effective. Handsome araucarias trimmed with streamers of apple green ribbon were set on pedestals and showed up well against the oak background. The reception at the house was under a canopy of lily of the valley and cattleyas.

E. Rosenbaum has opened a new florist store on Broadway, corner of 38th street. C. B. Nugent, formerly in business on 34th street, has been installed as manager.

James Purdy reports trade as opening

BLIGHT ON CARYOTA URENS.

much better than he expected at his new wholesale establishment on 43rd street. This is quite convenient to the up-town florist stores.

New wagons seem to be a sort of craze with the New York florists this season. Fleishman, Sears, Thorley, Scallen, Hession, W. Burns, Warendorff, Weir and Dailledouze Bros. are all sporting new wagons more or less dazzling in gold paint and plate glass, and with trimmings and liveries to match. John Weir's turnout is apparently not stylish enough for his own use, however, as he has been known to go home from the city in a hack on recent occasions.

The firm of Pitcher & Manda, of Short Hills, N. J., has been incorporated as a stock company under the laws of the State of New Jersey. The name, interests and management remain the same as before the change.

Ernst Asmus has just returned from his annual hunting excursion to the Megantic preserves in northern Maine. The net results of the trip were a caribou and a deer. After explaining to his friends the reason why he did not bring a dozen caribou and a couple of moose and laying all the blame on the gun, he donned his hat again, took up his grip and started for Chicago.

Joseph Manda, who has been in charge of the orchid houses at United States Nurseries for some years, has left that establishment and is now with Ilicks Arnold, Esq.

Thos. Young, Jr., has gone on a short trip to the World's Fair.

The first Roman hyacinths of the season made their appearance on the market on October 21.

## Philadelphia.

Nearly all the growers are now handling mums. Some have only a few, and others carry enough to fill a wagon, while Messrs. Harris, Anderson and several others will not commence to cut until the 23rd. Mr. Harris says there is nothing in the early ones for him and nearly all his stock is confined to late varieties.

The varieties in the market at this date (20th) are Kate Brown, Mme. Bergmann, Mrs. Whilldin, Gloriosum, Mme. Girard, a few Ivory, Mrs. Bullock and a few of other varieties that should not have been cut for a week. C. F. Evans brought in a few blooms of Mrs. Craig Lippencott that were extra fine; this variety will we believe bear out our predictions of last season; it is fully as large as Golden Wedding, a better grower and a more graceful flower, being a magnificent incurved yellow. Mr. Becket, of Oak Lane, is cutting some fine flowers of Ivory, Mrs. Bullock, and a new early pink one of his own raising. He exhibited a flower of this variety at the meeting of the Penna. Horticultural Society at its last meeting; it was the only specimen shown and a reporter stated that it stood sentinel over the interests of its race as they were discussed in the evening council. Mr. Becker can find here a good name for his "mum" if it is not already christened.

The best blooms sell for from \$2 to \$3 a dozen. Medium size flowers from 75 cents to \$1.50, while smaller kinds in sprays bring from 2 to 3 per hundred flowers. They are selling better than last week, and while it is likely there will be a great many thrown on the market for the next six weeks we do not anticipate much of a slaughter. Last season about this time we remember hearing some dire predictions made about the "weeds," but we presume they were not fulfilled, as there are likely to be more flowers this season than last, and the prophets are more heavily in it this year than ever. Chrysanthemums in pots are coming in pretty lively. Jacob Becker, Robert Craig, John Skelly, Geo. Uber and several others are sending in fine plants in from 6 to 8-inch pots; they bring from \$4 to \$12 per dozen.

Roses are plentiful and prices remain about the same, first class teas \$3 to \$4 per hundred. Meteors and Kaiserins \$4 to \$6. Small teas \$1.50 to \$2. Beauties and Belles \$1 to \$2 per dozen. Carnations are now in fine shape, but the best can still be had for \$1.25 per hundred, with very good ones for \$1. Shorts 75 cents. Valley is in good supply at from

BLIGHT OF VARIEGATED ENGLISH IVY.

\$3 to \$4. There is a limited supply of orchids at various prices, generally so much for the lot. Cattleyas seem to have the fixed price of 50 cents each the season round. Double violets are now to be had in quantity at 50 cents per hundred, the quality, however, seems to be some weeks away. Single violets are very plenty at from \$2.50 to \$3 per hundred bunches. Lonicera, of Liddonfield, has a limited quantity of the Czar, which sells very well.

The regular monthly meeting of the Penna. Horticultural Society was held last Tuesday evening and some important business transacted. The schedule of the spring exhibition to be held in the third week of March next was discussed and changes made. Secretary Farson said the prospects for the chrysanthemum show were excellent and that more entries were now in than ever before at this time. The cut rose exhibits, he said, would be very fine, judging by the number of entries. This was the meeting at which nominations of officers to serve for the ensuing year were in order, and the following gentlemen were nominated:

For president, Geo. W. Childs; vice-presidents, W. A. Reed, M. D., Robert Craig, Charles H. Miller, Geo. W. Earle, John Burton, Chas. W. Notter; recording secretary, D. D. L. Farson; corresponding secretary, Edwin Lonsdale; treasurer, Thos. Cartledge; professor of botany, Charles Schaffer, M. D.; professor of horticultural chemistry, Prof. Persifor Frazer; professor of entomology, A. C. McCook, D. D.; solicitor, W. B. Moore; librarian, D. D. L. Farson.

John Burton is in Chicago doing the Fair.

W. J. Baker proved himself to be quite general at ten pins and in the match at the alleys last Thursday night he marched his small army to victory, having a lead of some eighty pins at the close. He will have a chance soon to show his ability in

managing a defeat, which usually taxes the ability of great men to the utmost.

K.

#### A Blight of the Ivy.

This is not the first time that the writer has had something to say concerning the weakness of variegated plants. The white portion of a leaf is less able to ward off fungus enemies than the green parts, and this fact is no better illustrated than in the variegated sorts of the *Hedera helix*. Some years ago while making a special study of variegated plants this fact was brought to notice, but recently a more emphatic illustration came under my observation. From average samples of these blighted leaves, of which there were several hundred, the accompanying engraving has been made. In order to bring out the prevailing light color of the leaf the subjects were placed upon black velvet, thus giving them a dark background in the picture.

The form of variegation which prevails in the ivy consists of a blanched area around an irregular central portion. In some of the leaves this etiolated border extends nearly to the center, when the leaf is nearly entirely white. In others the green central portion reaches nearly to the margin.

The blight in like manner is quite uniform in its location, for it almost always begins midway of one side, that is, about half way between the base and apex and eating its way in does not stop at the line of the green area, but sweeping across blackens the whole leaf. Very often the blight begins at the same time upon both sides of the leaf, and the ruin is quickly effected.

Ivy of the ordinary sort growing near to and under the same circumstances as the variegated specimens are rarely troubled, but however are not entirely exempt.

The blight, that is, the turning brown

and dying of the white tissue of the leaf, is due to the inroads of a fungus of the anthracnose type. It abounds in spores which are the means of the rapid spread of the blight. These spores when they fall upon the etiolated portion of the leaf probably are better able to effect an entrance there than upon the green parts. When once in the threads grow rapidly and penetrate all portions irrespective of the coloration. After a short time the fungus develops small spots upon the surface like microscopic tufts of black hairs among which the spores are borne. Each blighted leaf in that way becomes a place where the disease germs are produced in vast numbers.

There are two leading, practical points in this connection. Let it be remembered that the variegated sorts of foliage are much more subject to blights than green ones of the same kind, and therefore if any one prefers the variegated to the ordinary sort he must bear this fact in mind and lend some assistance to his weakened pet. He can help by removing the blighted foliage as it appears or he may spray the vines with a fungicide. Those who indulge in variegated foliage plants must needs take more than ordinary precautions or else the blights will render unsightly what otherwise may be exceedingly attractive and beautiful.

BYRON D. HALSTED.

Rutgers College, October 6.

#### Boston.

There have been two or three society weddings in the past week, and most of the florists have had a fair share of funeral design work to make, but apart from this trade has been exceedingly dull and unsatisfactory all round. Roses bring not much more than one-half the price realized at this season in former years' and the demand for them even at the low prices is very light, a large proportion of them finding a market only through the hands of the street fakirs. Carnations have become plenty once more and are, like the roses, selling slowly and at reduced prices. Daybreak is unmistakably the best selling variety here this year. Wilder holds it own as far as quality is concerned. The theory of the "running out" of varieties gets a set back in the case of Wilder at least. At Wm. Edgar's there is a house of this variety which has never been excelled for quality and productiveness.

Chrysanthemums are with us—not the gorgeous specimens that will appear a little later, but in quality sufficient to give some indication of what general results are likely to be with chrysanthemums this year. That their popularity will be sustained and that while they are here other flowers will have to take the back seat may be taken for granted. But that the prices obtained in the past may be counted upon for this season is very unlikely. There will be some fine exhibition stock hereabouts, finer probably than anything shown by Boston growers heretofore.

The first heavy frost of the season came on October 17 and outdoor flowers were pretty generally finished up. The autumn foliage in the woods and fields has been unprecedentedly brilliant this fall, the weather being in all respects favorable to its best development. Out at the Arnold Arboretum it is interesting to note how many flowering shrubs there are which continue in bloom or flower for the second time late in the fall. One of the most showy flowers to be found among the shrubs at any time is *Gordonia Altamaha*, and it is still opening freely its beautiful

white camellia like blossoms, four inches in diameter. Several of the hypericums and spiræas are still flowering and clematis Boskoop Seedling does not seem to realize that autumn has come.

Miss Simpkins of Yarmouthport has offered a silver cup worth \$40 for the best twelve blooms of any pink variety of chrysanthemum, pompons excluded, stems to be not less than two feet long, to be competed for at the Boston exhibition.

Geo. C. Watson of Philadelphia, Winfried Rolker and J. A. Penman of New York and A. Dimmock of London have been among the prominent recent visitors to this town. Penman is making his second canvass with Nicholson's Dictionary of Gardening, and with such success that it seems as though there is almost no limit to the number of copies of this popular work which can be disposed of.

N. F. McCarthy has gone on a trip to the World's Fair.

#### Chicago.

Business during the past week has been quite good and continues to improve. Stock is plentiful; the small roses begin to suffer severely from the chrysanthemums, though the market for Beauties is not in any way affected. Chrysanthemums have greatly improved and some fine specimen blooms are now received. Miss Rosa Kupferle, a new pink from Cincinnati, very large and showy, has sold well; according to the wholesalers this is likely to prove a real acquisition. Wessee excellent Ivory, Domination and Glorioso from local growers. Some of these fine specimens have reached \$5 a dozen; others go from \$2 to \$4 a dozen, while the sprays of small flowers average \$4 a hundred flowers.

Roses and carnations suffer from the chrysanthemums, but the quality is good, and the quantity is considerable, owing to the abundance of bright weather. Violets are still scarce and go as high as \$1.50 for the best. Cosmos does not sell at all since the chrysanthemums came in.

Very few chrysanthemums as pot plants are grown for this market; a few are sent in, selling for \$3 to \$5 a dozen, but they are very poorly grown. It seems reasonable to believe that good pot plants would sell here as they do in other cities, but it is likely that the best are handled by retail growers and do not come into the open market at all. Still there should be something better grown than the shabby samples we see.

T. J. Corbrey is about to take a business partner in the person of Charles MacKellar, who has been manager for the Niles Center Floral Co. since the opening of the Cut Flower Exchange. The firm will be known as Corbrey and MacKellar.

The wife of Alfred Saxen of Downer's Grove died on the 13th inst.

On October 10 W. C. Cook cut some fine chrysanthemums that brought 50 cents each wholesale.

Recent visitors: A. W. McIntosh, Burlington, Vt.; Wm. Scott, Buffalo, N. Y.; T. H. Spaulding, Orange, N. J.; Frank Holzmagel, Detroit, Mich.; C. Rayner, Anchorage, Ky.; Thos. Archer, St. Joseph, Mich.; Wm. Cunningham, Geo. S. Hunter, Grand Rapids, Mich.; W. E. Hearne and wife, Oskaloosa, Iowa; Conrad Gindra, Poughkeepsie, N. Y.; G. J. Asman and wife, Detroit, Mich.; F. B. Smith, Danville, Ill.; J. Hess, Omaha, Neb.; Henry Gray, Nashville, Tenn.; W. E. Kemble, Oskaloosa, Iowa; Henry Michel and wife, Marion, Ind.

#### Baltimore.

The back yard flowers are not in it any more since Jack Frost's last visit, and those who want flowers now (may their names increase) have to buy them, to the great pleasure of the dealers therein.

Possibly when the great western show is over a further improvement in the market may be experienced, for there can be no doubt that much money that in ordinary years would have been spent in luxuries here has found its way to Chicago; and many a gentleman thinks twice before sending his innamorata that cluster of roses, that would have gone at once had his pocketbook not been depleted by a trip west. There is another side to it still, in the man who continues to send the roses but pays for them with promises, a currency pleasant enough to take, but hard to pass along, for coal, wages, etc. Every florist seems somewhat of a statesman and financier just now, in common with most other tradesmen, and many are the prophecies of amendment in the market when the conscript fathers, now in high debate in Washington, arrive at some sage conclusion and do some mighty wonder in national affairs. Altogether everybody seems hopeful, though complaints of slack business and slow collections are the general cry.

A trip to the Lutherville Nursery Co.'s houses showed everything in very neat condition. In one of the six large houses, two hundred feet long, were two very healthy benches of chrysanthemums, one mixed, the other L. Canning. There was in another house a bench of very fine cyclamens, and a house of young palms was in extra condition. Owing to some trouble with the brickwork of the boiler, which had to be repaired, preventing heating, there was considerable mildew on the roses, but with that exception everything looked very promising. A large stock of hedge plants, crataegus, euonymus, etc., outside seemed in perfect condition.

"Mums" are appearing in quantity, very good ones selling at from three to five cents. There is every indication of an enormous lot being put on the market here very soon, and it is to be hoped that sales will stiffen up considerably, or they will be a drug in short order.

Mr. J. J. Perry says the prohibition party is sure of another vote in twenty-one years if the voter he is raising lives that long. MACK.

#### Toronto.

Some of the carpet beds at the Horticultural Gardens are still (October 20) looking nearly as well as ever. The plants in the other beds have been all taken up and distributed among the school children. Mr. Watkins, the superintendent, has some very fine single stem chrysanthemums in the greenhouses; most of them are nearly at their best now and many would have been too early for the show even if the date had not been changed. Among the best and largest flowers were noticed Lizzie Cartledge, Ada Spaulding, Puritan (immense), Hicks Arnold (very fine), Sunflower (grand), Louis Boehmer (very large but muddy), Domination, Fleur l'Parfait (very pretty).

At a recent wedding chrysanthemums figured quite conspicuously.

Excitement concerning the show is gradually rising. The campaign has begun with every prospect of success.

The regular meeting of the Gardeners' and Florists' Association last week was

well attended. President Tom Manton was again in the chair. A lot of business concerning the arrangements for the chrysanthemum show was settled. A notice of motion was introduced, which, if it passes, will have the effect of putting the nomination and election of officers on the same day.

A good feature at the coming show will be the placing of uniform labels on all plants and cut flowers. It is proposed to have either an expert writer or typewriter in the secretary's office (probably the latter); each exhibitor will hand in his list of names and the expert will put them on the cards, put them in an envelope and give them to the exhibitor to place.

Trade still improving slowly. E.

#### St. Paul.

The florists report a better trade this week. Beauties are in good demand. Other roses are very plentiful, the bright weather of our "Indian summer" bringing blooms in abundance. Carnations are also in good demand, as are bouvardias. "Mums" are just coming into market. The supply is large and prices will undoubtedly rule low. In ten days or two weeks they will be abundant.

"Mums" are more popular than ever, even supplanting roses for bridal bouquets and the like. As long as they are so eagerly sought after our florists will grow them in abundance. One of the leading florists here told me a few days since that he considered his "mums" paid him better than anything else, not excepting roses.

A glance about town shows stock as a rule in excellent condition. A few roses have been badly mildewed, owing to negligence. They are now recovering under the influence of our bright sunny days.

By the way, our friend Donaldson, of Glass Block fame, in our sister city, is outdoing us all in his floral displays.

Our millionaire railroad magnate, Mr. Jas. J. Hill, has a very unique conservatory wherein are grown a variety of the choicest plants in the land. Some of our practical florists could learn much by visiting his establishment. FELIX.

### OBITUARY.

J. B. GUILLOT.

The death of J. B. Guillot fils, of Lyons, France, which occurred September 6 last, deprives us of one of the most distinguished rosarians in the world, to whom we are indebted for some of the most valuable roses now in commerce. He was born at Grenoble, France, in 1827, but two years later his father, J. B. Guillot pere, moved to Lyons, where he began to grow roses. Here the establishment which soon became famous in horticulture was founded in 1851. M. Guillot fils, sent out his first rose, Mme. Falcot, in 1858, and during the past thirty five years this has been followed by many others. In teas we need only mention such widely known and valuable varieties as Catherine Mermet, Mme. Hippolyte Jamain, Marie Guillot, Etoile de Lyon, Mme. Cusin and Mme. de Watteville, or the hybrid teas, La France and Pierre Guillot to show the value of his work. Since 1884, when his son, Pierre Guillot, became associated with the firm, they have sent out Countess de Frignense, Luciole, Mme. Hoste, Christine de Nougé and Gloire Lyonnaise. Some years since M. Guillot was decorated with an order of merit by the

TUBEROUS BEGONIAS IN THE NEW YORK STATE DISPLAY AT THE WORLD'S FAIR.

French government, in recognition of his labors, and his abilities were recognized wherever the rose is grown. His death removes one of the most notable figures in the rosarian's world, and he will be regretted, not only by his personal friends, of whom there are many, but also by horticulturists everywhere.

#### Insects on the Nelumbiums.

The insect pest on the nelumbiums is prevalent to such an extent on the plants in the locality of Washington that at least one grower of water lilies who had planted quite a number of roots has become disgusted with the ravages of the pest and given up nelumbium culture altogether. Where only a few plants are grown it is an easy matter to keep the plants clean. This is done by watching for the eggs and removing them before they hatch. So far as I have been able to make out there are two broods of the perfect insects each season. They evidently hibernate in the pupal state and emerge therefrom about the time the nelumbium leaves are fully developed. The eggs are oblong, nearly black and are deposited a great number together on the stems of the leaves and flowers which are above water; rubbing these off and crushing them between the thumb and finger is the easiest method of dealing with the pest. G.

#### Distributing Liquid Manure.

"Here is the tank we used to mix our liquid manure in and from which it was pumped to the houses, but we don't bother with such a cumbersome system now. We have something much simpler." Thus spake Mr. W. N. Rudd, of Mt. Greenwood, Ill., to the writer recently. "Here is what we use" he added showing us a combination hydrant attachment. "We attach this to the hydrant, then our hose to this opening, while from the other, we run a short section into a barrel of prepared liquid manure. The passage of the water soon sucks all the air out of the hose that connects with the barrel and the stream from the hose is then a mixture of half water and half liquid manure. There are attachments by which we can change the proportions to suit us, but we mix our manure of such strength that half and half with water is about right. This device saves us a great deal of labor. It is made by the Hose Connection Co., of Kingston, R. I. and was recently advertised in the *FLORIST*. I consider it a very valuable labor-saving device."

**CORRECTION.**—In our last issue, through an error, the titles of the two *davallias* illustrated were transposed. The one entitled *Davallia Mooreana* should have been named *D. Fijiensis*, and vice-versa.

LANCASTER, PA.—B. F. Barr's new range of houses is now completed, and they are models of convenience. The plant consists of about 20,000 feet of glass. Heating is by steam and ventilating by the Hippard apparatus.

OWING to rush of work in preparing for the exhibitions Mr. Elmer D. Smith was unable to prepare his usual batch of seasonable chrysanthemum hints for this issue. He will, however, continue his articles at an early date.

MR. WM. SCOTT has been doing the World's Fair the past week and as a consequence was unable to give us his customary batch of miscellaneous seasonable hints for this issue. He will be on deck again next week.

DO YOU WANT a list of the leading park superintendents of America? You will find such a list in our trade directory and reference book.

DO YOU WANT a list of the leading cemetery superintendents? You will find such a list in our new trade directory and reference book.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

VISITING CHICAGO: T. M. Griswold, Herman Simmers, W. A. Brotherton.

REGARDING ONION SEED prices for 1894, the impression seems to be generally that outside of white varieties prices will be lower than last season.

S. B. DICKS of Cooper, Taber & Co. left New York October 21 on the Etruria, after a ten week's stay in this country. He found trade very satisfactory in every respect.

News Notes.

TUSCOLA, ILL., is reported to be in need of a florist establishment.

GUELPH, ONT.—W. M. Mann has added a new house 60x21 and put in another boiler. He now has four fine houses.

NEW HAVEN, CONN.—The annual chrysanthemum show by the New Haven Club will be held at Harmonie Hall, November 8, 9 and 10.

HAMILTON, ONT.—John Morgan, formerly of Englewood, Ill., has located here and started in business at 471 King William street this city.

GREENFIELD, IND.—Jacob Forest, who has leased the Roger greenhouse, has overhauled and restocked the establishment and built a new office.

ATLANTA, GA.—Mrs. A. Lambert announces a fall opening and chrysanthemum show at her greenhouses beginning October 30 and continuing one week.

MILWAUKEE, WIS.—N. Zweifel has built a new place at 14th street and Groeling avenue, consisting of three houses 18x85 each. One is planted to roses, another to carnations and the third is devoted to general stock.

YONKERS, N. Y.—A chrysanthemum show will be held here October 31 to November 4 inclusive, under the auspices of the Yonkers Tentonia Society. A premium list has been issued and copies may be had on application to the manager of the show, Mr. John Beattie, Riverdale, New York City.

DALLAS, TEX.—The floral display at the Texas State Fair and Dallas Exposition this year was finer than ever and attracted much favorable comment. Of the first premiums taken by professional florists 10 were awarded to Ernst Nitsche, 8 to Texas Seed and Floral Co., 4 to H. Holtkamp and 4 to Grant C. Smith.

NYACK, N. Y.—A man calling himself W. B. Heymen and claiming to be a florist endeavored to work a novel swindle here. He visited several florists and offered to buy their establishments. After getting price and terms settled satisfactorily at one place he "found himself short of money for the moment" and wanted to get a check cashed. He did not succeed in getting any of his checks cashed here but did succeed in borrowing \$4 from one florist. He will probably try to work this scheme elsewhere, and florists should be on their guard. He is a smooth faced man, with features resembling those of J. K. Emmet, the well-known comedian.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

The debits are printed in black and the credits in red, so they can be readily distinguished. They are put up in blocks of 100; 50 of each, placed back to back; thus but one block will have to be carried. By means of these tickets an entry of a sale or receipt of goods can be made anywhere—in the house or in the field—and afterwards filed. Tickets for each transaction in your business will make data from which a book-keeper can readily work. With this simple and easy means of keeping a record of your business can you afford to neglect so important a matter?

Price of Tickets, postpaid, 100, 20c.; 200, 35c.; 300, 50c.; 500, 75c.; 1000, \$1.40.

AMERICAN FLORIST CO.,

## GREENHOUSE HEATING.

BY A. B. FOWLER.

Explains fully all the best systems of heating greenhouses by both hot water and low-pressure steam. Tells you the points to consider in selecting an apparatus. How to adjust same to various locations; gives the results of the latest scientific experiments. Shows how to compute the number of feet of pipe required for a given space; draft and other important matters. It is highly commended by Mr. John Thorpe and others. Postpaid, 75c.

Sent on receipt of price. Address,  
**AMERICAN FLORIST,**  
 CHICAGO

Judging at the Toronto Show.

I was very glad to see a letter on this subject in your issue of October 12 from Mr. F. G. Foster, because I think that whoever is right or wrong good is likely to come from having the matter ventilated. There are one or two points however on which I should like to set both Mr. Foster and myself right. I did not lose sight of the fact that the schedule called for "the best display of plants" but I contend that the plants were not displayed in the pyramids, one could only see one side or the top of most of them. Certainly the most artistic table (as Mr. Foster admits) did not contain the best plants, but if the prizes were awarded for the best plants, should not Mr. Houston's table—which Mr. Foster says contained "the choicest and best plants in the hall"—have come in for one, even though many of them were literally buried. Mr. Foster must have seen them to know whether they were buried or not. If the plants in the other pyramids were not actually buried they were as I said before half hidden. Thus according to Mr. Foster's own words "one of the most artistic pieces of nature I ever saw" was awarded fourth prize and "the choicest and best plants in the hall" were left out altogether.

As to the "hybrid" table Mr. Foster is in error if he thinks that I took any of the credit for its get up, I merely worked on it mechanically and I wish to say that I never handled healthier, better grown or more saleable florist's stuff. The get up of the table was at least an endeavor to get out of the old rut, every plant could be seen and judged, so that if, as I understand Mr. Foster to say, the plants were judged (not the whole table as an artistic production) I can see still less than before how this "hybrid" came to be left out in the cold. I will readily admit that my statement that Mr. Foster asked for assistance was made from hearsay but it was emphasized in my mind by what he said last year, viz: that he felt very much inclined to go to the manager and ask for help in judging these same tables. However, if I did an injustice to him or his associates on this point I beg humbly to apologize right here.

I am very glad to hear that Mr. Foster is still a strong advocate of the single judge system, so am I, but I cannot help sympathizing with the single judge all the same.

Now in conclusion I think the whole thing comes to this: Tight bouquets had to go, and now tight artistic displays of plants must go, whether the class is open to all or not, and it is the duty of the Gardeners' and Florists' Association to see to it that the wording of the schedule is made especially clear next year.

A. H. EWING ("E.")

Toronto, October 16, 1893.

THE Society of Indiana Florists has issued a program for its coming chrysanthemum show at Indianapolis, and the secretary has favored us with a copy. It includes the full premium list with announcements of special attractions for each day and the complete musical program.

B. S. G.—The nearest we have come to getting exact data on the point you raise will be found in the article on page 1302 of our issue for July 20 last (No. 269), to which you are referred.

WHEN writing our advertisers please use one of your printed business letter heads or enclose your business card.

**NOW** is the time to order the above. Pot the plants as soon as received and plunge the pots into a cold frame, where they will winter at little expense. Root action will begin almost at once, and the plants will be in the best possible condition to bring into your houses at the proper time, with much better result than if potted up late in winter or early spring.

If you are in need of **PALMS, FERNS** or other **DECORATIVE STOCK** do not fail to consult our trade list. We have forty houses filled with this class of plants, all in the best possible condition for immediate sales.

## Recent Legal Decisions.

Liability of express company for delivery to impostor.

An express company is bound at its peril to deliver packages consigned to its care; and a failure to do so, not induced by any negligence of the consignor, will not excuse it, regardless of the fraud or imposition which induced a delivery to an impostor. *Shearer vs. Pacific Exp. Co.* Ill. App. 8 L. G. D. 1700.

State discharge of insolvents does not bind non-resident creditors.

A state insolvent law is not extraterritorial in its operation, and consequently a discharge under it cannot release a debtor from his contracts with citizens of other states, unless they voluntarily participate in the insolvency proceedings. The discharge of the debtor and his subsequently acquired property from liability for his antecedent debts is subject to the qualification that non-resident creditors who do not voluntarily place themselves within the jurisdiction of the insolvent court shall not be affected or bound. *Downes vs. Fisher.* Ct. App., Md. 27 At. Rep. 121.

Liability of incoming partner for debts of old firm.

It is a universally conceded doctrine that, when a new member is admitted to a firm, he becomes one of the firm for the future, and not for the past. There is not only no presumption that the incoming partner assumes pre-existing debts, but the presumption is that he does not. In order to render an incoming partner liable to the creditors of the old firm, there must be some agreement, express or tacit, to that effect entered into between him and the creditors, and founded on some sufficient consideration. *Wolff vs. Madden.* Sup. Ct. Wash. 33 Pac. Rep. 975.

Mention the American Florist when writing to advertisers on this page.

## Suggestion for Telegraphic Code.

Below you will find a simple yet concise and expedient code which purchasers of cut flowers may appreciate and perhaps adopt:

25 white carnations—Hope.  
25 red carnations—Faith.  
25 pink carnations—Grace.  
Long stem—full.  
Short stem—less.  
50—ly.  
25—ness.

It will be seen that the annexes ly or ness add each their respective number to the original 25 of the first word, thus: If 50 short stemmed red carnations are wanted the word would be "Faithlessness." If 75 long pink, the word would be "Gracefully." If, however, 100 or more are wanted, put the one before the kind in the usual manner, thereby annulling the original 25. If then 150 short white were wanted, the words would be "One hopelessly." K.

## To Combat Grasshoppers.

It is too late to help Mr. Rudd this season but he will find the following a sure cure for grasshoppers: 6 pounds bran, 1 pound common arsenic, 1 pound powdered sugar, with water enough to make a mash. The grasshoppers will take it in preference to chrysanthemums, and it is warranted incidentally to kill any domestic animal that eats it, as well as rabbits, gophers, etc. Drop the poison on the ground in small bits. This remedy is from the *Rural New Yorker*, and it works.

Arsenic is worth about 10 or 15 cents a pound and the amount mentioned is enough for two acres or more of land. It is cheap and effective and the only fault I find with it is its liability to kill birds and animals as well as the grasshoppers. Milwaukee. CHAS. L. MANN.

Cause of Black Spot.

A correspondent sends us a communication advancing several facts noted by him in support of his opinion that black spot is caused by mulching the rose beds and that "mulching will have to be abandoned for those that are subject to spot." As black spot has not been at all particular to confine itself to roses in mulched beds in the past his theory seems to be based on a very fragile foundation.

Referring to the matter a well known rose grower says. "With a heavy mulching it is very easy to over or underwater and anything which checks or enfeebls the plants, especially "wet feet" or a damp cold night atmosphere, will produce spot on the hybrid teas. There is nothing about a mulch of proper material applied to a bed of vigorous roses when the soil is well filled with roots to do anything except stimulate growth only as it makes it more difficult to water properly. As to the plants working up into the mulch of course the roots will go to the manure. If it were possible to put the manure under instead of on top of the soil the roots would go down instead of up and still there would be no check."

Catalogues Received.

Wm. Parry, Parry, N. J., nursery stock; Wm. H. Spooner, Jamaica Plain, Mass., roses; C. L. Brunson & Co., Paducah, Ky., cut flowers and plants; V. Lemoine et fils, Nancy, France, plant novelties.

"Dreacina Judavissi."

We have often noted curious and wonderful misspelling of plant names in advertisements sent us, but the above, which we finally interpreted as *Dracena indivisa*, seems truly remarkable.

KROESCHELL BROS.  
IMPROVED  
Greenhouse x Boiler,  
41 to 55 Erie St., CHICAGO.

Boilers made of the best of material, shell, firebox sheets and heads of steel, water space all around front, sides and back). Write for information

Jackson Ave. and Pearson St., Long Island City, L. I.

STANDARD FLOWER POTS

Every user of Flower Pots should correspond with us before purchasing elsewhere, our facilities are unequalled.

A. H. HEWS & CO., N. Cambridge, Mass.

Announcement to Florists.

We desire to announce the dissolution of the firm of Sipfle Dopffel & Co., and to introduce to the trade its successor, The Syracuse Pottery Co., which will be under the management of William Dopffel and Conrad Breitschwerth. The business will be conducted as heretofore, except on a larger scale to meet the growing demand for our goods. We have accordingly enlarged our plant and capacity, and with unsurpassed facilities are now prepared to fill the largest order on short notice. Our latest improved machines are turning out the best and most serviceable flower pots in the market, and assuring you of our intention to lead in further improvements we solicit a continuance of your patronage in the belief that we can supply just what is needed at a price and in a manner satisfactory to all.

Send for price list and samples and we know you will give us an order.

SYRACUSE POTTERY CO. OFFICE: 403 North Salina Street, SYRACUSE, N. Y.

A MOISTURE TENT for house plants is an excellent idea suggested by Julius Koenig of St. Louis. It is a noticeable fact that most plants used for room embellishment suffer greatly from the dry atmosphere, and sprinkling does not help this much. This difficulty is gotten over, however, by keeping them in a moist atmosphere at night. For this purpose a bell-shaped tent is made of heavy cotton flannel, large enough to cover the plants to be so treated. A frame of wood or wire is made to support it. Every night the tent is dipped into water, slightly wrung out, and placed over the plants. If it dries out very rapidly it may be sprinkled again. Mr. Koenig tells us he knows a case where *Adiantum trapeziforme* and other ferns, as well as a variety of palms, were kept in perfect health as house plants under this treatment. It seems a valuable little wrinkle for some of the retail florists, for their own benefit as well as for their customers, for where there is no greenhouse hospital for store plants they soon suffer if there is not some refuge from the dry atmosphere prevailing in a store.

### Miscellaneous Seasonable Hints.

Your palms will now be brought into active service for decorations of various kinds, and as severe winter weather will soon be here it will be impossible to continually tie and box these plants, expose them to a low temperature and occasionally a gas jet, without their showing the effects of such rough treatment, and they are bound to get a flaw here and there, not enough to render them any the less valuable for decorating, but imperfect enough to spoil their sale to any one who wants to purchase a nice palm for his house. The only way to keep some perfect palms for sale is to make a dividing line in your palm house, and keep your perfect young palms at the warm end, and don't let them attend any weddings, receptions, etc. under any circumstances whatever. Stick to this rule and you will always have some perfect plants.

Easter is very early this year, and where sweet peas are sown to succeed chrysanthemums it will be hard work to get the peas in flower by Easter. If they are midseason or late chrysanthemums it will be a month yet before you can get the sweet peas sown. If the latter are of much consequence to you sow some in 4-inch pots. You can get a start of six weeks in this way, and their earliness will repay the extra trouble.

If you have not already lifted your *Hydrangea Otaksa* from the ground or frame they have been growing in all summer do so at once, a little frost has not hurt them. It helps to ripen the wood, but hard freezing will hurt the buds. *Hydrangeas* are tremendous feeders, and soon fill the pots with roots, so give them good sized pots with a coarse mixture of soil and a fourth of rotten cow manure. We can't all afford a bench for them in a very cool house, but they will do very well stood along the edge of the path in a cool light house. They are not making any growth for two months, and the absence of light won't hurt them till they begin to grow.

*Cytisus* is usually a little early for Easter if kept in a house with an ordinary greenhouse temperature. Keep them with your Easter azaleas, as cool as possible without freezing.

It is time now to start up the old stock fuchsias to give you cuttings. The wood should be ripened now if they have been kept almost dry for the past six weeks. Shake the old soil clean off them, shorten back the slender tips of the shoots, and start them going in a moderately warm house and with plenty of syringing. It is the early struck cuttings that make the really fine plants, because they show no inclination to flower till spring time, when they should be fine plants. By the time the last batch of cuttings is taken off the old plants want to flower, and the cuttings then are too precocious, wanting

to flower when only a few inches high. The old fashioned way of growing a fuchsia to single lead or pyramid form made handsome plants, but not as useful or as salable to the commercial florist as one that has been stopped twice and has five or six leaders. These want little tying and make fine bushy plants.

When *Spiræa Japonica* (astilbe) arrives don't pot it till you have given the clumps a good soaking in a tub of water. Last year I saw several lots that were a partial failure, and I believe the neglect of this simple operation was the only cause. I like to put them out of doors after potting, and cover with an inch or two of litter of some sort, and leave them there till forcing time comes. This year it should be soon after New Years.

Don't let greenfly get a foothold on your early *Harrisii* lilies, nor on the poinsettias, which are now beginning to develop their bracts. They quickly ruin the latter, and if once down in the heart of a lily are hard to get rid of. Constant and light fumigating must be the rule.

Buffalo, October 30. WM. SCOTT.

### Azaleas.

Probably a much greater number of azaleas are imported from Europe each season than are raised here, and the treatment of newly imported stock was very aptly described by Mr. Scott in his interesting notes in a recent issue of the *FLORIST*, but it should also be remembered that these plants can be successfully cultivated in this country, though this branch of the business has been neglected by many growers from the fact that other specialties have promised larger returns. The imported plants are very well grown in most instances, and are now reasonably cheap, and do not occupy space for any great length of time before becoming salable, but there seems to be but little doubt that home grown stock could also be produced at moderate cost and in good quality if its cultivation was entered upon in the same systematic manner that has been adopted for various other crops.

The propagation of azaleas is not specially difficult, either by means of cuttings or grafting, the first essentials being good clean cuttings of young wood, or very similar soft young growths for grafts. The best cuttings are formed from young shoots two to three inches long and taken off with a heel of firmer wood attached, these being planted in 6-inch pots in such quantity as not to crowd the cuttings too much. The cutting pots should be filled with light soil, preferably of a peaty nature, and with a layer of clean sand on the top, the whole being made very firm and well watered before the cuttings are inserted therein. They should then be placed in a propagating frame and well shaded, keeping

the frame close during the day in bright weather, but giving enough ventilation at night to prevent any excess of moisture. Under proper conditions the cuttings will be rooted in from three to six weeks, and should then be potted off at once into small pots, and as soon as the new roots get into action should be given plenty of light and air and syringed frequently to avoid the attacks of thrips. After this the young plants should be potted on as they require it, and also be pinched into shape, as they would otherwise become too straggling.

The grafted plants may be handled in a very similar manner after the grafts have united, this first step in the process requiring the most care. Healthy, straight stocks for grafting on are the only suitable ones, one of the best varieties to use for this purpose being the old purple variety known as Phœnicia, this being a strong growing and free rooting sort, and forms suitable stocks in a short time. The grafts should be formed of moderately soft young shoots, and of course should be manipulated only with a very sharp knife, for bruised wood does not readily unite, and side grafting makes the neatest job and also a firm union, the graft being secured in place with a close binding of raffia or similar tying material. The grafts should be treated in much the same manner as the cuttings, keeping them quite close for a time and watering carefully. As soon as the union has taken place the bandage should be removed, and after growth begins the plants should be potted on and encouraged to move rapidly, the young shoots being pinched regularly to induce a shapely growth.

If space will permit, it is a good plan to plant out the young plants during the summer, either on a bench in a greenhouse or out in a frame, a slight shading being beneficial, the most suitable arrangement for this purpose being a light framework formed of laths spaced about half an inch apart. In the fall the plants should be lifted and potted up, and can then be stored for the winter in a cool house or a heated pit or frame, a temperature of 45° at night being quite enough to keep them in good condition. At the end of the second year there should be some salable plants among the lot, though naturally much depends on the way in which they have been cared for.

The only serious pests to which azaleas are subject are red spider and thrips, but these may be avoided by occasional fumigations and regular and frequent syringing, a good pressure of water being very discouraging to either of these vermin.

Regarding soil, it may be stated that good azaleas can be grown in pure loam, providing it is not too clayey, and the roots of these plants being very fine they should always be potted quite firmly, though giving careful attention to the drainage of the pots at all times. But where the loam is of poor quality and very tenacious it is safer to use some peat in the compost, and in some portions of the far west some difficulty may be experienced from the prevalence of alkali in the soil, the latter being more or less injurious to plants of this character.

W. H. TAPLIN.

#### Carnation Notes.

Everything having started off nicely by this time it is well to begin looking around and see what is what. You will observe that the list of varieties I grow is very small, as I have found by experience (some of it costly) that it pays to grow only the best of each color. Having adopted this principle there is not a carnation on the place this season that will not do well and pay, if there is any pay in the business.

Daybreak is the carnation of all carnations; of course the growth is somewhat scrawly, and it seems the natural habitat of the red spider, but when you get two prices for the flowers a few defects can be overlooked. Those on benches are producing side buds, and the terminal bud is very apt to burst, but those in solid beds are producing no side buds and the calyx is perfect.

Lizzie McGowan, Mr. Robert Craig says, is the "bread and butter carnation," and he is about right, for the florist who has it need never starve for want of flowers. Those that are in solid beds are making all long stems without any side buds, and those on benches are full of side buds, making a fine lot of short and enough of long, so the bench seems the place for it.

Silver Spray being very early can be handled so as to fill up the gap before chrysanthemums come in. It makes all long stem flowers, some of them deformed and worthless. These can easily be recognized as soon as they begin to open, and if they are pulled off every time the flowers are pulled you save your plants the labor of producing worthless bloom, and will get plenty of good from them. They do best in solid beds.

Grace Darling is a good one, doing equally well on benches and in solid beds. If it produces side buds pinch them off and give it pretty liberal feeding, with a warm house to grow in.

Aurora is doing well on benches and is very prolific in good large flowers. In solid beds it is comparatively worthless.

Edna Craig in solid beds is sustaining the claims made for it, and they were about all that could be made for a carnation. Annie Pixley is a new one not yet sent out, and gives promise of being a grand variety; next season I shall grow nothing in pink but these two; they are both an exquisite shade, having large flowers with long stems and vigorous growth.

Fred Dorner is with me among scarlets what McGowan is among whites; it is the best scarlet I know of up to date, and were it not for the fact that some growers are not willing to give Portia up for a newer one there would have been none of the latter on the place. Portia is, however, doing very well, the dry summer seemingly having hardened the plants up better than usual, and better flowers are the result.

J. R. Freeman is a very good crimson, but the crimsons do not sell well, and next year there will be none of that color planted here.

As my soil does not seem suited to Buttercup Golden Triumph is grown for

yellow and has proven a profitable variety, but I am looking for a better one. To tell the truth I am always looking for a better one, and when I see one it is bought in quantity enough to fill a house or two, and one of the older varieties has to make room for it. A. M. HERR.

#### Carnations at Kennett Square, Pa.

Kennett Square, Pa., is a town famous alike for its great poet and traveler, Bayard Taylor, and its magnificent carnations. We recently paid a flying visit to this place and found the carnations have all been housed and are now in fine condition. Never was there better promise of a large crop of flowers. Some eight or ten growers ship from this point, and the weekly output through the winter months will not fall much short of thirty to forty thousand blooms. When it is considered that only fifteen years ago Chas. T. Starr, the father of this industry in the so-called "carnation belt," could stall the Philadelphia market with a "bushel of carnations," the wonderful progress made in southern Chester county is really surprising. For even the Kennett Square supply is not more than one fourth of the total number of carnations shipped from this district.

But this section is celebrated not only for its quantity and quality of blooms, but also for its production of new varieties. Buttercup, Century, Golden Gate, Chester Pride, Edwardsii, L. L. Lamborn, Pride of Kennett, Aurora, Grace Darling and a host of lesser lights were sent out from this vicinity. At the present time there are several workers in this field and we may expect some surprises in the near future. The introductions for the present season are not many. In fact the carnation has now reached such perfection that a new seedling must be something very fine indeed if the conscientious grower deems it fit for distribution. There was a time when a good pink was badly wanted. Grace Wilder seemed to be the ideal in color, only it had the bad habit of coming at times streaky, and in other ways failing to behave in a proper manner. But there is little doubt now of the want being supplied. We have Grace Darling, Aurora, Fred Creighton, Grace Battles, Edna Craig, Wm. Scott and finally Sweet Brier and Ophelia. The latter two are offered for sale the first time this year, and seem to be the culmination of a great deal of thought and care on the part of Edward Swayne, the originator. Mr. Swayne has made a special study of hybridizing for the production of a first-class pink carnation, and how well he has succeeded a visit at the present time to his house would testify. Ophelia is a fine flower, often expanding three and one-quarter inches, and borne on stout stems. The plant is robust and productive. In color like Grace Darling, rather darker than Wilder. The house of this variety now in bloom is truly a sight worth seeing. Ophelia took the Craig cup at the Philadelphia show last fall. Sweet Brier is rather lighter in color and of a pure pink, entirely free of the purple streaks so often found in Wilder. It is deliciously fragrant, and borne on very stiff erect stems that are generally free from lateral buds.

Mr. Swayne has made an experiment of great interest to the trade, but certainly not to his own profit. Early in September he potted a number of Sweet Briers from open ground into 4 and 5-inch pots, keeping them out doors and transferring to benches inside later. The

FANCY CALADIUMS AND GLOXINIAS IN PENNSYLVANIA STATE EXHIBIT AT THE WORLD'S FAIR.

plants that were shifted directly into the benches are today looking very fine and blooming freely, while those that were potted are a sorry sight indeed—full of dead leaves and showing no signs of bloom. The experiment is a disappointing one, as one would expect to see a contrary result.

We cannot close this article without calling attention to the superb house of McGowans to be seen at Mr. Swayne's. It is worth traveling many miles to see.

Avondale, Pa. W. R. SHELMIER.

Boston.

The present demand is entirely inadequate to match the supply of roses, carnations and chrysanthemums which the growers are daily piling on to the market. Looking back over the record of recent years we find that this is not much different from the usual conditions at this particular season, for it has been regularly a period of over production and dull business, not only here but in all the large centers of the cut flower trade. The most disquieting feature this season is the low prices, which in the case of roses and chrysanthemums especially have fallen to an unprecedented level. In fact there is no level, and no such thing apparently as a minimum price, and if the growers of these staples can exist and thrive under present conditions one begins to wonder

why with former figures they did not all become princes. Another unpleasant but undeniable fact is that the street fakirs are handling about as good stock as are the regular stores. The goods which they display are no longer the refuse and low grade stock, and this fact alone cannot fail to have an unfavorable effect generally on legitimate trade. But there is consolation in the thought that like other torments of the warm weather they must withdraw from the field as soon as freezing weather sets in.

The chrysanthemum show will open on November 7. Judging from current comment there will be some blooms there the like of which have never been seen. One establishment, of which we may have more to tell next week, is likely to break all records and move the peg up to a notch which will necessitate some tall climbing on the part of future competitors. As to seedlings the prospects are also good, and although the number shown may not be large yet some meritorious ones may be looked for. The prizes offered amount to nearly 1,100 exclusive of specials. Edward Hatch has offered three prizes of \$25, \$15 and \$10 for the best vase of twenty yellow chrysanthemums.

Lawrence Cotter is one of our best chrysanthemum growers. As with a great many others, Ivory is a leading variety with him, and he is cutting large

quantities of superb blooms. W. H. Lincoln promises to be equally good. Last year no finer blooms were shown at the chrysanthemum show here than Cotter's Lincolns. Jessica, Mrs. J. N. Gerard and Rohallion are about all cut already, and H. E. Widener, Ada Spaulding, Domination and Vivian-Morel will follow closely on them. On a few plants of Vivian-Morel where crown buds have been allowed to come the blooms are poorly formed and very pale in color. Mrs. Craig Lippencott, the new hairy yellow, is very promising. Harry May and Beacon are not nearly as good as last year, and Golden Wedding is a complete failure. "Not much use commercially" was Mr. Thorpe's verdict on Pelican last year. Mr. Cotter does not agree, he calls it one of the very best. Both Pelican and V. H. Hallock are in splendid shape. A promising sport from Mrs. S. Humphreys has appeared here; the color is an unusually soft shade of lemon yellow.

Speaking of roses Mr. Cotter says that Meteor has been his salvation this year, as nothing else would bring any kind of a price. He is not alone in this experience. As in previous years hybrid roses and longiflorum and Harrisii lilies will take the place of chrysanthemums when these are gone. An interesting experiment is a house of American Beauties treated as hybrids. They have been dried off and the canes tied down, and look as if they

would throw a big cut for Christmas.

S. J. Coleman at J. M. Galvin's place is another grower who has attained a big reputation as a chrysanthemum grower. Among the varieties seen here are many of the new ones, of which *The Queen* and *Nivens* are the most satisfactory. Both these varieties are showing up finely. *Golden Wedding* does poorly and mildews badly. Col. W. B. Smith is excellent, so is *Domination*, *Ivory*, *Cullingfordii* and several of the older favorites. *Vivian-Morel* has lost its color somehow and is almost white. Mr. Coleman attributes it to the fertilizer used.

Part II of the transactions of the Massachusetts Horticultural Society for the year 1892 is just out. It contains full reports of all the meetings and exhibitions of the year, from April 2, also the annual reports of the chairmen of the various exhibition committees, a list of all the accessions to the library during the year and much other interesting and instructive reading.

The prizes offered by the Boston and Maine R. R. for the best displays of plants and flowers at its stations, for 1893, have been awarded as follows: First prize, \$50, Belmont, Mass.; second prize, \$40 each, Madbury, N. H., and Portsmouth roundhouse; third prize, \$20 each, to Bell Rock, Brattle station, Cliftondale, Cross street, East Lexington Turnpike, Mass., Kennebunk, Me., Atkinson and Greenland, N. H. A number of smaller cash prizes were awarded to other stations. The total prizes awarded amounted to \$700.

George A. Sutherland succeeded the firm of Peck & Sutherland November 1.

#### New York.

The situation remains unchanged in the cut flower trade. Retailers and wholesalers alike agree in pronouncing the present demoralized condition of business as unprecedented. As far as chrysanthemums are concerned there appears to be a contributing cause for the depression, in the very apparent efforts on the part of certain retailers to disseminate among the public the idea that these flowers are no longer fashionable. But the chrysanthemum is not dead yet, even though it be true that the chappies have abandoned its use as a boutonniere for street wear.

The committees in charge of the approaching exhibition at the Grand Central Palace are doing very effective work, and judging from the system which prevails in all their preparations and the great number of entries constantly being received the exhibition will surpass all its predecessors in merit. The children's day, Wednesday, November 8, promises to be very interesting. Already over three hundred entries have been made by the little ones who received young plants last spring through the medium of the Kindergarten Plant Association. The number of special premiums offered is very large, and the list is being increased daily.

Pitcher & Manda's annual chrysanthemum show is now going on. To those who have by constant visits become familiar with the magnificent display of orchids and show plants of every description which is always to be seen at this great establishment the most interesting feature just now is the house of selected seedlings, the best twelve hundred varieties out of over thirty thousand seedlings raised last year. Nothing approaching this show has ever been seen in this country. As the greater part of them is

still held under number only a detailed account of the most notable varieties is deferred until such time as they shall be entered in public exhibition under name. One variety, however, which has been already named Pitcher & Manda may be mentioned as one of the grandest introductions in chrysanthemum history. The center of the bloom is deep brilliant yellow. From this outward it shades off gradually to pure white, the white and yellow each covering about one half of the flower, which is very large and well formed. The tuberous begonias in the houses make a magnificent display, almost rivaling the chrysanthemums in attractiveness to the visitors, who have thronged the houses every day since the exhibition opened.

Chrysanthemums at Rudolph Asmus' place in New Durham are worth seeing. *Vivian-Morel* has never been seen herein better shape than he has it. Mrs. J. G. Whilldin, Mrs. M. J. Thomas, Miss Minnie Wanamaker and Rohallion are also superb. Among the newer ones Emily Hitzeroth, Col. W. B. Smith and *Nivens* are equally satisfactory. Jos. H. White is a great favorite with Mr. Asmus. Its flowers are very firm, and he regards it as one of the very best keepers.

As soon as the chrysanthemums are off, daisies and carnations take their place. Mr. Asmus has one of the finest houses of Meteor to be seen. This is a house which was piped for forcing bulbs, and hence is well equipped to give the Meteor the high temperature which it requires. Mr. Asmus says that this was the best paying house on the place last year.

Bonn & Dressel are among the few bulb forcers who did not get either frightened or cured by the discouraging results of last year's investments, for they will force more than ever this year. This is the place to see fine dracaenas, araucarias, aspidistras, kentias, arecas and other commercial foliage plants. Their stock is clean and handsome. The outside surroundings of the place are a good index of indoor conditions. Well raked walks, tidy borders and handsome groups of rhododendrons and hardy conifers greet you on your approach, and you feel at once that the same habits of tidiness which keep the weeds down outside will outwit the bugs on the inside. Nevertheless, cyclamens, which were formerly a good crop here, are out of the question now, owing to an unmanageable fungus which attacks the foliage.

Nelson & Schupp have opened a new wholesale cut flower establishment at 142 West 31st street.

Mr. E. V. Hallock has severed his connection with the establishment of John Lewis Childs.

#### Philadelphia.

This is chrysanthemum time, and a great time it is, "mums" are to be seen on every hand, the pot plants now coming in adding not a little to the display.

*Ivory* is much the best white so far, every one seeming to have them good, although there is quite a difference in the size of the flowers. Some growers are almost cut out of it, while others say theirs is hardly fit to send in. Minnie Wanamaker is making her appearance, the first being cut on the 27th by Scott & Son and C. E. Evans. Some of Mr. Evans' flowers were the largest we have ever seen of this variety. Robert Craig is cutting some fine flowers of the *Queen*, a very pure white incurved with large

petals, and some fine specimens of *Maud Dean*, a pretty pink. Edwin Lonsdale has had some magnificent blooms of Mrs. Craig Lippencott, they measure from 7 to 9 inches in diameter, with stems 4 feet long. This variety has the call on the yellows, no other can compare with it; it has one fault, however, it lacks substance, not being as solid a flower as *Lincoln*, *Widener* or *Golden Wedding*. It looks now as though it would be cut out by the time these varieties are ready. The smaller stock sold in bunches is now being sent in, *Le Neige*, *Gloriosum*, *Source d'Or*, *Elaine*, Mrs. M. Davis and Mme. Bergman being the principal kinds.

The price, well there are all prices, the best are now bringing \$2 per dozen, then \$1.80, \$1.50, and very good flowers can be had for \$1. A number of growers have sprays with from two to four flowers to a spray, these sell, the best for \$1 per dozen sprays, there is then a size for 75 cents a dozen, another at 60 cents, and then the bunches at from 25 to 35 per bunch.

Considering the quantity there is about the sales may be considered good and the demand increasing.

Pot plants have fallen considerably in price. Six-inch stock of *Ivory*, Whilldin, *Le Neige* brings from \$2.40 to \$3 per dozen, 8 and 9-inch pot plants \$4 to \$6 per dozen. Roses are feeling the effects of the rivalry and are very plentiful. Beauties seem to be hard to sell at present, at least all those who carry them generally say Beauties first, and just before the boxes are strapped up if not sold they are given another chance. Casper Pennock, of Lansdowne, is on top with *La France*, his stock at present is the best of any we have seen this season, and we have seldom seen better at any time.

The best teas bring \$3 to \$4. Choice fancy stock \$4 to \$6. Smaller roses \$2. Beauties and Belles 1.50 to 2 per dozen, with from 14 to 16 to a dozen. Carnations are very plentiful and the demand is fair, \$1 per hundred is about the price for good stock, while a few extra fine bring \$1.25. Mr. Harris has some good Edna Craig that he is asking \$2 for; it is choice stock and likely to bring high figures this winter. Elmer J. Weaver, Ronks, Lancaster Co., has very fine Lizzie McGowan and Daybreak, the best we have seen this season; they are handled by S. S. Pennock. Double violets are getting a shade better and sell for 50 cents per hundred, single \$3 a hundred bunches. Valley is \$4. No Romans as yet. Smilax \$12 to \$15 per hundred.

A. L. Pennock & Son have dissolved partnership, the place being divided. Mr. A. L. Pennock will direct one-half, while his son Casper will manage the other.

Charles E. Meehan was married October 24, the bride being Miss Mary K. Hetzel, of Germantown. There were three bridesmaids who carried *Perle*, *La France*, and *Meteor* roses, while the bride's bouquet was of Brides and valley. It was a house wedding followed by a reception, at which there was a large gathering of friends. The house was elaborately decorated. Mr. and Mrs. Meehan left shortly after on a tour. A long and happy life to them is our wish, and we feel sure that Charlie's right arm will surely suffer before he gets over his route on his return, as the boys are all laying for him.

It was a great game at the alleys last Thursday night, the score was very close all the way though, but Wm. J. pulled his men up at the finish, winning by eleven

ARRANGEMENT OF ORCHIDS AND FERNS IN NEW YORK STATE EXHIBIT  
AT THE WORLD'S FAIR.

pins. Kennedy's three strikes in the last frame did the business, while three very difficult spares by the same player earlier in the match brought the boys to their feet with shouts of approbation. George Craig also put up a fine game; he has been No. 1 for five matches in succession.

A large canvas advertising the show has been placed in front of Horticultural Hall; one of the prominent features is a vase of the golden flower in which is to be seen one of a decided bluish tint. This color may be seen at the show, but we doubt it, as Uncle John has corralled all this variety for the Chicago display. He has also captured our Bob, who will no doubt show them a thing or two, but we will have the best show as far as plants go at any rate, for so says Daniel. K.

Chicago.

At the last meeting of the Florist Club officers for the ensuing year were elected as follows: P. J. Hauswirth, president; J. F. Kidwell, vice-president; T. F. Keenan, recording secretary; Hubert Maas, financial secretary; J. T. Anthony, treasurer.

It was decided to have the annual banquet on Thursday, November 9, during the World's Fair Chrysanthemum Show. The club is now seven years old. Mr.

Chas. McKellar will read a paper on "packing flowers for shipment" at an early meeting. The subject is a timely one and the paper will undoubtedly be listened to with much interest.

There was much enthusiasm regarding the World's Fair Chrysanthemum Show, and all present agreed to help to the full extent of their ability.

Miss Eloise, daughter of J. A. Pettigrew, superintendent of Lincoln Park, was married to Mr. Geo. T. Sisson, on the 25th inst. The house was very tastefully decorated with plants and flowers, an arrangement of autumn leaves and chrysanthemums in a corner being exceptionally attractive.

The World's Fair banquet, given at the Auditorium, October 25, by the National Commission to President Palmer and the foreign commissioners, was decorated by P. J. Hauswirth. The banquet hall is a very handsome one, even in its ordinary condition, and on this occasion state flags formed a series of panels along the walls, while the colors of all the nations decorated the frieze above. Specimen palms and other plants, loaned for the occasion by Chief Thorpe, stood in the corners and in niches along the wall. Long garlands of smilax and other green crossed and re-crossed over the panelled ceiling, while in the center hung a huge

cone, apex downward, formed of yellow chrysanthemums. Numerous electric lights were disposed through this cone, which flashed out red, white and blue, with a beautiful effect.

The main table extended the full length of the room, seven other tables being disposed at right angles to this. All down the main table, facing the others, were large semi-circular banks of yellow chrysanthemums. At either end, on cross tables, were two adjoining arches of green, with banks of chrysanthemums at the bases; these arches were joined by another arch, springing across from table to table. The arches supported electric lights, red, white and blue, making a band of radiance through the delicate green. The effect of the lights and flowers was really lovely. Further decoration on the cross tables was formed by vases of chrysanthemums. Chrysanthemums in pots were used with the other plants; palms and bay trees were disposed in the ante room. This was one of the handsomest decorations of the World's Fair season.

Business is fairly good, with chrysanthemums decidedly on top. There is no overstock of fine specimen blooms at present, and they sell well, the best bringing \$4 a dozen. Vivian-Morel is beginning to come in; this is a favorite variety, and there are fine flowers of Mrs. E. D. Adams and Miss Minnie Wanamaker. The best selling colors are without question yellow, pink and white, with white and yellow leading in favor. Bronzes and crimsons do not sell; a few fine blooms of Geo. W. Childs were noted, but there is no sale for them. A quantity of Louis Boehmer was noted at several places, but this variety sells poorly. Roses stay about the same, though Beauties show an advance for the best. Poor roses have become practically unsalable since the advent of the chrysanthemum. Among carnations, Edna Craig and Daybreak bring the highest price, being ranked as fancies, at \$2. Violets are still scarce; a few of the variety Lady H. Campbell have been received, and created a very favorable impression.

A good deal more is going on now in the social world, increasing the demand for flowers, and the death of Mayor Harrison has also made an impression on the local trade. Among designs ordered by persons connected with the City Hall were a chair five feet high, surmounted by an eagle, a gates ajar of colossal size and an immense standard star and crescent.

Recent visitors: I. N. Marsh, Plattsburg, Ohio; John Bingham, Warwick, N. Y.; David Rust, with H. A. Dreer, Philadelphia; U. G. Scollay, Brooklyn, N. Y.; J. Wilkinson Elliott, Pittsburg, Pa.; Stephen Taplin, Detroit, Mich.; John Burton, Chestnut Hill, Philadelphia; F. G. Foster, Hamilton, Ont.; R. F. Lawrence, Short Hills, N. J.; C. D. Thayer, Worcester, Mass.; Thos. Young, Jr., New York City; Ernst Asmus, West Hoboken, N. J.; Andrew Bather, Clinton, Iowa; C. P. Grimmer, Boston, Mass.; Gus Knoch and wife, Woodmere, Mich.

ERIE, PA.—It has been finally decided not to hold a chrysanthemum show here this year.

ALBANY, N. Y.—Park Superintendent Egerton is making a chrysanthemum display in Washington Park, which commenced November 1 and lasts a week.

Please mention the AMERICAN FLORIST every time you write to an advertiser.

## Buffalo.

The chrysanthemum crop is in and soon will be in full blast. Up to date the best flowers have retailed for \$2.50 or \$3 for very fine; small flowers for what you can get. Only the very earliest have been offered in any quantity, and there has been no surplus at present. Ivory for white and Whildin for yellow are the standard varieties for early cutting. Hicks Arnold, Mrs. Wm. F. Dreer and Col. W. B. Smith are in good form at this time. The supply of roses is still abundant, and prices low for this time of year, except perhaps in the case of Beauty, the supply of which has shortened up considerably. Meteor seems as great a favorite as last year, and we all have to keep it. The first big lot of carnations are gone and they are not now seen in such quantities, but are better in quality. Daybreak, on account of its delicate color and grand stem, is in the lead. There has been a number of small weddings recently, helping out business. The sudden death (killed at one of the many grade railroad crossings with which our city is cursed) of Mr. Porter, the popular superintendent of Buffalo's street railway, called for a number of large and elaborate designs, the employees of the different barns and offices each sending a handsome piece. Among the many fine offerings was a trolley car, finely executed by W. J. Palmer & Son.

After a good long vacation the Florists' Club got together last week, and, although not numerously attended, the meeting was lively and interesting. A member brought in a set of resolutions, which he asked the club to adopt, denouncing in most decided terms the undue advertising and soliciting of their business in connection with funeral orders. Some of the charges were grave, others were of an ordinary style, and what I fear can be noticed in every city. The discussion brought every member to his feet in earnest too. With one or two exceptions every member present denounced severely any approach to advertising one's business on such an occasion. The subject proved so important in the opinion of the majority that it was laid on the table till our next regular meeting, which will bring out a large attendance I am sure, and you shall receive the opinion of our club on this delicate subject after that.

Wm. Scott has opened a branch store on Elk street in the most populous part of South Buffalo. The opening occurred on a Saturday noon, and although a very slight inducement was offered to visit the store it took a sergeant and two patrolmen to keep the street clear, and the visitors had to be let into the store in blocks of thirty and then out at the rear.

All florists who read these notes, particularly in this vicinity, will please (if they have not already) send to Mr. Michel of St. Louis, as requested by him in the *FLORIST* two months ago, an account of their fire insurance. Great benefit may come to all of us by united action; and all should feel interest enough in the subject to answer the questions without delay. I have not the questions before me; they are, however, briefly this:

What amount of glass have you?

How much insurance do you carry?

What proportion on stock, and what on buildings?

What rate of insurance do you pay?

It is surprising to me how few florists on their return from the World's Fair have much to say about this great sight, unequalled in the history of the world.

It is true you cannot describe it, but I can say you cannot afford to miss it. The stories of extortion and robbery are pure humbug. The management is superb. The neatness and cleanliness of the grounds is a revelation and the buildings and their contents "passeth all understanding." There may be bigger things at the Fair than Horticultural Hall and the Persian theatre, but the new varieties, sports and variations are to be seen at every turn. There is time yet.

W. S.

## St. Paul, Minn.

Retail trade has improved somewhat. Prices run about as follows: Perles, Niphetos, Mermets and Bons, \$1 per dozen; Albany, La France, Bride, Wootton and Bennetts, \$1.25 per dozen; Meteors, Testout and Kaiserin, \$1.50; Beauties, \$3 to \$4 per dozen. Carnations, 40 to 60 cents per dozen; "Mums," from 75 cents to \$4 per dozen.

The supply is good and the quality excellent. Beauties are in great demand, with supply meagre. Mums are selling well, both blooms and potted plants. A. S. Swanson has one house planted to mums grown to single stems. They are fine, bring a good price and are as remunerative as potted plants. If more were grown in this manner we think better flowers and better prices would be the rule.

Stock about town is looking fine. May & Co. have a house of Albany and La France that can't be beaten anywhere. Every plant is loaded with buds and every bud seems to come to perfection. Their rose growers, Messrs. Souden and Wild, seems to have the art of "making" roses under any and all conditions. We presume the secret of it all is constant watchfulness and plenty of nourishment.

Chris Hansen is just now cutting some beautiful roses, Perles, Bennetts, Beauties, Brides, etc. Chris is a hard, conscientious worker and deserves success.

Our genial Alderman Warren seems to be as successful in growing flowers as in selling real estate. Like everything else he undertakes it is bound to move. The warm sunshine of his presence will make the "desert bloom" every time.

E. F. Lemke has some nice roses; in fact he always has them in season and out, and his houses always show the care and attention he bestows upon them.

The fact is, St. Paul is well represented by live, hustling florists who know their business, know how to grow flowers and how to serve them out to its critical buyers among the "four hundred."

We are having a little cold snap, and fires have to be kept up all the time now. Six months of continuous firing with coal at "combine" prices will keep prices of flowers right whether the supply and demand are equal or not. Florists here have not and will not engage in cutting prices simply because a few flowers go to waste.

A large department store in Minneapolis is offering roses for Monday at 25 cents per dozen. Surely these must have been cut in Chicago on Friday or Saturday. What will they be like when our debutante wears them to the ball Tuesday night? Withered flowers indeed, and we fear withered hopes for the young galant at her side who bought them on "bargain day."

Some of our florists intend to go to the "Mum" show in your city. We have not learned what they propose to exhibit. We hope, however, that they will return

laden with trophies, for surely no finer flowers were ever seen under glass than are now being cut in the saintly city.

FELIX.

## Floral Decorations.

It is a little early yet to say much about styles in decoration for this season; perhaps we shall see nothing very startling, for changes, as a rule, come about very gradually. Unfortunately for the florist, corsage bouquets have practically disappeared, a single specimen bloom being about the only thing worn, and that only occasionally. Violets, however, still retain full favor for street wear, and it is not likely that they will ever go out of fashion.

In table arrangements the prevailing taste is still for rather low plateaus, nothing that will destroy the line of vision being permissible. The practice of arranging the favors, loose bunches, into this plateau, so that they can readily be removed, is a commendable one, and seems to be gaining ground. There is certainly an increasing favor shown to smilax, in place of asparagus; apart from its gracefulness it stands so well and does not suffer where electric lights are used in conjunction with the flowers. These lights are used so much now in banquet or ball decoration that it becomes necessary to consider the durability of the flowers used with them.

During chrysanthemum time we see some very pretty effects obtained by the use of autumn leaves as foliage. The colors harmonize admirably with the flowers, and the heavy leaves show to much better effect than light sprays. The use of oak and other well colored foliage in church decoration has produced some very pretty effects.

There is no doubt that the favor shown to orchids is really increasing; they appear in dinner, wedding, luncheon and reception arrangements. On the table few flowers equal them, and for mantels and wedding canopies they are very rich. We see rather more fine plants used now than formerly in room decoration, and there is a tendency to avoid the formality of heavy banks, and to distribute them in harmony with the general plan of the room.

For funeral flowers there is a decided reaction against stiff designs, though many of them are still made. But flat bunches, or cypress leaves with a knot of flowers, undoubtedly lead. People with a love for the symbolic, however, still crop up, and we heard recently of an order in memory of a departed carpet layer, which consisted of a flight of steps with partially unrolled stair carpet, and on it a broken shears and carpet stretcher! Such monstrosities, however, become rarer every year.

LEXINGTON, KY.—Mrs. Honaker has this year made great improvements in her greenhouses, having erected one rose house (considered by all who see it the finest in the state) 30x150 feet, all iron and cypress, with 16x24 double strength glass; a carnation house 12x150, chrysanthemum house 12x150 and palm house 20x75; all iron and cypress, double strength glass, heated by steam, with boiler shed 20x80 feet. Two more houses 11x150 feet will be started soon, making fully 1,400 feet of new houses this season. Bell, the florist, has issued a handsomely gotten up announcement of a display of chrysanthemums at his store October 30 to November 1.

ASTER NOVÆ-ANGLIÆ.

ASTER NOVÆ-ANGLIÆ ROSEA.

## HARDY ASTERS.

## Hardy Asters.

We present illustrations of two hardy native asters which should find a place in every herbaceous garden. We are prone to neglect our native plants, though their beauty and usefulness is amply recognized abroad. Any one who has noted the show made by native asters on the Wooded Island at the World's Fair, after other flowers were past, and this in spite of a most trying season, will recognize their fitness for a place in the hardy garden.

## Random Chicago Notes.

Discussing the question of bulbs in pots recently with a Chicago wholesaler, he gave his experience when managing a store business. Each year he bought good hyacinths and tulips, named sorts, and planted them either singly or several in a large pot. Being good fresh bulbs and good varieties they were very attractive, and there was never any trouble in selling. They probably cost four to six dollars a hundred, but a pot containing six blooming bulbs sold easily for seventy-five cents in the store. But the usual practice with a great many growers is to wait until one of the seed stores offers the cullings of their bulb stock at a low price, buy this refuse, pot it up, and then sell off the lot for anything they will bring. They argue that they can afford to sell these plants off cheap around Easter or early spring, because they didn't cost much to buy, and cost nothing to grow. Perhaps this is the reason why a big dry-goods house in Chicago was able to sell blooming tulip plants at eleven cents

each last Easter. They were really worth that too. But people who saw the advertisements of that sale, without seeing the quality of the stock, would be very apt to object to paying for better stuff in a florists' store. Still, there seems no doubt that a certain amount of well grown, good quality bulbs will pay in pots or pans—if for nothing else they will make a fine show in the florists' windows, as anyone who has seen Thorley's window so decorated in New York will agree.

We find chrysanthemums in pots rather neglected here; the prevailing stock is certainly weedy. A good many of them look as if they had been planted out, and then suddenly taken up and jammed into a pot. A very good looking, even-sized benchful was noted recently at J. F. Kidwell's place, well furnished with leaves, and well set with bloom, showing good care in pinching and disbudding, as well as feeding, but unfortunately few grown for the wholesale market seem of this style. Growers should remember that it pays to disbud the pot plants; a fair allowance of fine blooms will make a better showing than a haphazard sprinkling of undersized sprays.

Speaking of chrysanthemums, it seems this year as if white leads all other colors in the cut flower market, with yellow second, and pink third. Dull pinks do not sell at all, nor do bronze or crimson. One can hardly wonder that Louis Boehmer does not sell, the color being so livid and the flower being rather unattractive in form. This, by the way, is the only hairy flower coming into the Chicago market. Mrs. Hardy appears to be dead here, and we do not see any of the newer ones.

White chrysanthemums are being used so largely in funeral work, as everything else that they affect the market for the useful carnation. The only rose not affected in any degree by the chrysanthemums is the Beauty. "Fine roses fifty cents a dozen" is a familiar sign now in the stores.

## Chrysanthemum Notes.

VISIT the flower shows and note the varieties you like best. See the old and the new kinds, and mark that while a fine flower is a desideratum, a plant or cut bloom to have merit nowadays must have stout stems as stiff as a poker and clean, deep green, succulent foliage from the base to the bud.

SEEDLING CHRYSANTHEMUMS are very easily raised and make a great show of blossoms the first year. As a rule they are of vigorous constitution, and if grown to bushes make big plants that bear a large quantity of blossoms. All manner of flowers—large and small, double, semi-double and single, and of all types and colors peculiar to the race, are found among them.

HAIRY FLOWERS are getting most as common as plain ones, and many colors are now represented among them. Indeed, in a pretentious greenhouse establishment the other day we saw such a large lot of this year's seedling hairy chrysanthemums in bloom, that the florist is preparing them all for seed-bearing, intending to offer the seed of the hairy flowers as a novelty in his catalogue next spring. And it will be a worthy novelty too.—*Gardening, Nov. 1.*

## The Seed Trade.

## AM. SEED TRADE ASSOCIATION.

W. ATLEE BURPEE, Philadelphia, president; A. L. DON, secretary and treasurer, 116 Chambers street, New York. Next annual meeting second Tuesday in June, (will probably be held in Toronto.)

VISITED CHICAGO: William Meggat, C. C. Morse, J. M. Kimberlin & Son, W. C. Langbridge, F. R. Pierson, H. G. Faust, R. Engelmann, E. Schaettel.

A FEELING of uncertainty as to spring trade makes a dull seed market at present. Those who are offered apparent bargains hesitate to purchase in the face of dull business, want of cash, and a distrust of the spring demand.

## Funeral Flowers for Chicago's Mayor.

Mayor Harrison's untimely end brought out an ocean of floral tributes, showing various degrees of taste and a most generous expenditure of money. At the City Hall, where the remains laid in state, to be viewed by thousands, an improvised death chamber was formed by draperies of black cashmere. Ropes of smilax were stretched and looped in curves over this black background, the smilax being twisted with pink and white roses. At the bottom of each loop was a wreath of roses and chrysanthemums. At regular intervals were three black draped stands, bearing floral emblems.

On the casket was a wreath of laurel leaves encircling the name plate. Below this were a wreath of lily of the valley and a pillow of roses. Running down from the foot of the casket to the floor was a great scroll of white roses, bordered with pink, bearing in purple the name of the Mayor's newspaper, the *Times*. Against the head of the casket was a great shield of white chrysanthemums, marked in floral letters as a tribute from the city map department.

Among other noticeable designs were a big star of white roses and chrysanthemums; a municipal shield five feet high, made of white, pink and yellow roses, with quarterings of chrysanthemums; a circle of roses three feet in diameter; a model of the late Mayor's house, five feet high, in white chrysanthemums and roses; wigwam of white chrysanthemums, orchids and valley; shield surmounted by a crown, tied with Italian colors, the gift of Italian societies; floral stairway, the stairs marked with the dates of Mr. Harrison's several inaugurations as mayor, with at the top open gates of roses; vacant chair five feet high, made of white chrysanthemums and valley, with a floral eagle on top; large old fashioned clock of white chrysanthemums and yellow roses, the hands stopped at the hour of the mayor's death; pillow of roses with star in center and words "Central Detail" below. In addition to these there were wreaths, crosses, broken columns and anchors without number; without doubt the greatest number of elaborate designs ever seen at any funeral in Chicago. The effect on the flower trade was quite marked.

## SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant ads. not admitted under this head.

**SITUATION WANTED**—With florist or grower, by young lady accustomed to the business. Address M. B., care American Florist, Chicago.
